# SURFACE WATER SUPPLY OF HUDSON BAY AND UPPER MISSISSIPPI RIVER BASINS, 1924

### AUTHORIZATION AND SCOPE OF WORK

This volume is one of a series of 14 reports presenting records of measurements of flow made on streams in the United States during the year ending September 30, 1924.

The data presented in these reports were collected by the United States Geological Survey under the following authority contained in the organic law (20 Stat. L., p. 394):

Provided, That this officer [the Director] shall have the direction of the Geological Survey and the classification of public lands and examination of the geological structure, mineral resources, and products of the national domain.

The work was begun in 1888 in connection with special studies relating to irrigation in the arid West. Since the fiscal year ending June 30, 1895, successive appropriation bills passed by Congress have carried the following items:

For gaging the streams and determining the water supply of the United States, and for the investigation of underground currents and artesian wells, and for the preparation of reports upon the best methods of utilizing the water resources.

A nnual appropriations for the fiscal years ending June 30, 1895-1925

1895	\$12, 500. 00
1896	
1897 to 1899, inclusive	
1900	<sup>2</sup> 70, 000. 00
1901 to 1902, inclusive	
1903 to 1906, inclusive	200, 000. 00
1907	. 150, 000. 00
1908 to 1910, inclusive	. 100, 000. 00
1911 to 1917, inclusive	. 150, 000. 00
1918	. 175, 000. 00
.1919	. 148, 244, 10
1920	. 175, 000. 00
1921 to 1923, inclusive	
1924 to 1925, inclusive	

In the execution of the work many private and State organizations have cooperated, either by furnishing data or by assisting in collecting data. Acknowledgments for cooperation of the first kind are made in connection with the description of each station affected; cooperation of the second kind is acknowledged on page 10.

Measurements of stream flow have been made at about 4,990 points in the United States and also at many points in Alaska and

<sup>1</sup> Includes \$4,500 appropriated in act of Apr. 25, 1896.

Includes \$20,000 appropriated in deficiency act of Mar. 30, 1900,

the Hawaiian Islands. In July, 1924, 1,670 gaging stations were being maintained by the Geological Survey and the cooperating organizations. Many miscellaneous discharge measurements were made at other points. In connection with this work data were also collected in regard to precipitation, evaporation, storage reservoirs, river profiles, and water power in many sections of the country and will be made available in water-supply papers from time to time.

### **DEFINITION OF TERMS**

The volume of water flowing in a stream—the "run-off" or "discharge"—is expressed in various terms, each of which has become associated with a certain class of work. These terms may be divided into two groups—(1) those that represent a rate of flow, as second-feet, gallons per minute, miner's inches, and discharge in second-feet per square mile, and (2) those that represent the actual quantity of water, as run-off in inches, acre-feet, and millions of cubic feet. The principal terms used in this series of reports are second-feet, second-feet per square mile, run-off in inches, and acre-feet. They may be defined as follows:

"Second-feet" is an abbreviation for "cubic feet per second." A second-foot is the rate of discharge of water flowing in a channel of rectangular cross section 1 foot wide and 1 foot deep at an average velocity of 1 foot per second. It is generally used as a fundamental unit from which others are computed.

"Second-feet per square mile" is the average number of cubic feet of water flowing per second from each square mile of area drained, on the assumption that the run-off is distributed uniformly both as regards time and area.

"Run-off in inches" is the depth to which an area would be covered if all the water flowing from it in a given period were uniformly distributed on the surface. It is used for comparing run-off with rainfall, which is usually expressed in depth in inches.

An "acre-foot," equivalent to 43,560 cubic feet, is the quantity required to cover an acre to the depth of 1 foot. The term is commonly used in connection with storage for irrigation.

The following terms not in common use are here defined:

"Stage-discharge relation," an abbreviation for the term "relation of gage height to discharge."

"Control," a term used to designate the natural section or stretch of the channel or artificial structure below the gage which determines the stage-discharge relation at the gage. It should be noted that the control may not be the same section or sections at all stages.

The "point of zero flow" for a gaging station is that point on the gage—the gage height—at which water ceases to flow over the control.

If the base data are insufficient to determine the daily discharge tables giving daily gage height and records of discharge measurements are published.

The description of the station gives, in addition to statements regarding location and equipment, information in regard to any condition that may affect the permanence of the stage-discharge relation, covering such subjects as the occurrence of ice, the use of the stream for log driving, shifting of control, and the cause and effect of backwater; it gives also information as to diversions that decrease the flow at the gage, artificial regulation, maximum and minimum recorded stages, and the accuracy of the records.

The table of daily discharge gives, in general, the discharge in second-feet corresponding to the mean of the gage heights read each day. At stations on streams subject to sudden or rapid diurnal fluctuations the discharge obtained from the rating table and the mean daily gage height may not be the true mean discharge for the day. If such stations are equipped with water-stage recorders the mean daily discharge may be obtained by averaging discharge at regular intervals during the day or by using the discharge integrator, an instrument operating on the principle of the planimeter and containing as an essential element the rating curve of the station.

In the table of monthly discharge the column headed "Maximum" gives the mean flow for the day when the mean gage height was highest. As the gage height is the mean for the day it does not indicate correctly the stage when the water surface was at crest height and the corresponding discharge was consequently larger than given in the maximum column. Likewise, in the column headed "Minimum" the quantity given is the mean flow for the day when the mean gage height was lowest. The column headed "Mean" is the average flow in cubic feet per second during the month. On this average flow computations recorded in the remaining columns, which are defined on page 2 are based.

## ACCURACY OF FIELD DATA AND COMPUTED RESULTS

The accuracy of stream-flow data depends primarily (1) on the permanency of the stage-discharge relation and (2) on the accuracy of observation of stage, measurements of flow, and interpretation of records.

A paragraph in the description of the station gives information regarding the (1) permanence of the stage-discharge relation, (2) precision with which the discharge rating curve is defined, (3) refinement of gage readings, (4) frequency of gage readings, and (5) methods of applying daily gage height to the rating table to obtain the daily discharge.

For the rating tables "well defined" indicates, in general, that the rating is probably accurate within 5 per cent; "fairly well defined," within 10 per cent; "poorly defined," within 15 to 25 per cent. These notes are very general and are based on the plotting of the individual measurements with reference to the mean rating curve.

The monthly means for any station may represent with high accuracy the quantity of water flowing past the gage, but the figures showing discharge per square mile and run-off in inches may be subject to gross errors caused by the inclusion of large noncontributing districts in the measured drainage area, by lack of information concerning water diverted for irrigation or other use, or by inability to interpret the effect of artificial regulation of the flow of the river above the station. "Second-feet per square mile" and "run-off in inches" are therefore not computed if such errors appear probable. The computations are also omitted for stations on streams draining areas in which the annual rainfall is less than 20 inches. All figures representing "second-feet per square mile" and "run-off in inches" published in the earlier reports by the Survey should be used with caution because of possible inherent sources of error not known to the Survey.

Many gaging stations on streams in the irrigated areas of the United States are situated above most of the diversions from those streams, and the discharge recorded does not show the water supply available for further development, as prior appropriations below the stations must first be satisfied. To give an idea of the amount of prior appropriations, a paragraph on diversions is presented in each station description. The figures given can not be considered exact but represent the best information available.

The tables of monthly discharge give only a general idea of the flow at the station and should not be used for other than preliminary estimates; the tables of daily discharge allow more detailed studies of the variation in flow. It should be borne in mind, however, that the observations in each succeeding year may be expected to throw new light on data previously published.

### PUBLICATIONS

Investigation of water resources by the United States Geological Survey has consisted in large part of measurements of the volume of flow of streams and studies of the conditions affecting that flow, but it has comprised also investigation of such closely allied subjects as irrigation, water storage, water powers, ground waters, and quality of waters. Most of the results of these investigations have been published in the series of water-supply papers, but some have appeared in the monographs, bulletins, professional papers, and annual reports.

The results of stream-flow measurements are now published annually in 12 parts, each part covering an area whose boundaries coincide with natural drainage features as indicated below:

Part I. North Atlantic slope basins.

II. South Atlantic slope and eastern Gulf of Mexico basins.

III. Ohio River basin.

IV. St. Lawrence River basin.

V. Upper Mississippi River and Hudson Bay basins.

VI. Missouri River basin.

VII. Lower Mississippi River basin.

VIII. Western Gulf of Mexico basins.

IX. Colorado River basin.

X. Great Basin.

XI. Pacific slope basins in California.

XII. North Pacific slope basins in three parts:

A, Pacific slope basins in Washington and upper Columbia River basin.

B, Snake River basin.

C, Lower Columbia River basin and Pacific slope basins in Oregon.

Water-supply papers and other publications of the United States Geological Survey containing data in regard to the water resources of the United States may be obtained or consulted as indicated below.

- 1. Copies may be purchased at nominal cost from the Superintendent of Documents, Government Printing Office, Washington, D. C., who will, on application, furnish lists giving prices.
- 2. Sets of the reports may be consulted in the libraries of the principal cities of the United States.
- 3. Complete sets are available for consultation in the local offices of the water-resources branch of the Geological Survey, as follows:

Boston, Mass., 2500 Customhouse.

Albany, N. Y., 21 Washington Avenue.

Trenton, N. J., Statehouse.

Charlottesville, Va., care of University of Virginia.

Asheville, N. C., 316 Jackson Building.

Chattanooga, Tenn., 830 Power Building.

Columbus, Ohio, Engineering Experiment Station, Ohio State University.

Chicago, Ill., 1510 Consumers Building.

Madison, Wis., care of Railroad Commission of Wisconsin.

Rolla, Mo., Rolla Building, School of Mines and Metallurgy.

Helena, Mont., 45-46 Federal Building.

Denver, Colo., 403 Post Office Building.

Salt Lake City, Utah, 313 Federal Building.

Idaho Fall, Idaho, 228 Federal Building.

Boise, Idaho, Federal Building.

Tacoma, Wash., 404 Federal Building.

Portland, Oreg., 606 Post Office Building.

San Francisco, Calif., 303 Customhouse.

Los Angeles, Calif., 600 Federal Building.

Tucson, Ariz., 106 College of Law Building, University of Arizona.

Austin, Tex., State Capitol.

Honolulu, Hawaii, Territorial Office Building.

A list of the Geological Survey's publications may be obtained by applying to the Director, United States Geological Survey, Washington, D. C.

Stream-flow records have been obtained at about 5,800 points in the United States, and the data obtained have been published in the reports tabulated below.

Stream-flow data in reports of the United States Geological Survey

The records at most of the stations discussed in these reports extend over a series of years, and miscellaneous measurements at many points other than regular gaging stations have been made each year. An index of the reports containing records obtained prior to 1904 has been published in Water-Supply Paper 119.

The following table gives, by years and drainage basins, the numbers of papers on surface-water supply published from 1899 to 1924. The data for any particular station will be found in the reports covering the years during which the station was maintained. For example, data for Machias River at Whitneyville, Maine, 1903 to 1921, are published in Water-Supply Papers 97, 124, 165, 201, 241, 261, 281, 301, 321, 351, 381, 401, 431, 451, 471, 501, and 521, which contain records for the New England streams from 1903 to 1921. Results of miscellaneous measurements are published by drainage basins.

### COOPERATION

In Montana the work was carried on in cooperation with the United States Bureau of Reclamation. With the exception of the station on St. Mary River near Babb, all stations in Montana were maintained jointly with the Reclamation Service, Department of the Interior, Canada.

In North Dakota the work was carried on in cooperation with the State engineer.

In Minnesota the work was carried on in the Red River drainage basin in cooperation with the Minnesota State Drainage Commission, E. V. Willard, commissioner, and with the United States Weather Bureau (Mississippi River at St. Paul and Minnesota River near Mankato) and United States Engineer Corps (Mississippi River at Elk River and Minnesota River near Montevideo).

In Wisconsin the work was done in cooperation with the Railroad Commission of Wisconsin, C. M. Larson, chief engineer, and with Northern States Power Co. (Red Cedar River near Colfax, Red Cedar River at Menomonie, St Croix River near Grantsburg, St. Croix River near Rush City).

In Iowa the work was carried on in cooperation with the State Geological Survey, George F. Kay, director; Iowa Highway Commission, F. R. White, chief engineer; and Mississippi River Power Co., of Keokuk, Iowa, Albion Davis, hydraulic engineer.

The United States Weather Bureau paid the salaries of gage observers for stations on Cedar River at Cedar Rapids and part of the salaries of observers for stations on Des Moines River near Boone and Tracy, and Raccoon River at Van Meter. The Interstate Power Co., of Chicago, paid the salary of the observer for the station on upper Iowa River near Decorah.

In Illinois work was carried on in cooperation with the Illinois Department of Public Works and Buildings, division of waterways, W. L. Sackett, superintendent. The Central Illinois Public Service Co. paid the salary of the observer on South Fork of Sangamon River at power plant near Taylorville.

In Missouri the work was carried on in cooperation with the Missouri Bureau of Geology and Mines, through H. A. Buehler, State geologist.

### DIVISION OF WORK

The data for stations in the Hudson Bay basin in Montana and North Dakota were collected and prepared for publication under the direction of W. A. Lamb, district engineer, assisted by E. F. Chandler and A. H. Tuttle.

The data for stations in the Hudson Bay basin in Minnesota were collected and prepared for publication under the direction of S. B. Soulé, district engineer, and by E. F. Chandler, assisted by Ray V. Tilley and Richard B. Black.

The data for stations in the Mississippi River basin in Wisconsin and Minnesota were collected and prepared for publication under the direction of S. B. Soulé, district engineer, assisted by F. C. Christopherson and Edgar E. Foster.

The data for stations in the upper Mississippi River basin in Iowa were collected and prepared for publication under the direction of J. B. Spiegel, district engineer, assisted by Albion Davis, C. Herlofson, and P. L. Mercer.

The data for stations in the upper Mississippi River basin in Illinois were collected and prepared for publication under the direction of H. E. Grosbach, district engineer, assisted by A. M. Wahl.

The data for stations in the upper Mississippi River basin in Missouri were collected and prepared for publication under the direction of H. C. Beckman, district engineer, assisted by V. L. Austin, W. S. Frame, and H. H. Brittingham.

The manuscript was reviewed and assembled by J. W. Mangan.

### GAGING-STATION RECORDS

### HUDSON BAY DRAINAGE BASIN

### ST. MARY RIVER NEAR BABB. MONT.

Location.—In SE. ½ sec. 27, T. 36 N., R. 14 W., above headworks of United States Bureau of Reclamation St. Mary Canal and 1 mile east of Babb, Glacier County, on Blackfeet Indian Reservation.

Drainage area.—278 square miles (including area of Swiftcurrent Creek above point of diversion into St. Mary Lake); measured on topographic maps. Records available.—April 9, 1902, to September 30, 1924.

GAGE.—Stevens water-stage recorder on right bank 20 feet above diversion dam and referenced to staff gage which reads head over crest; read by Wm. J. Dorrington and J. L. Bassett.

DISCHARGE MEASUREMENTS.—Made from a cable 500 feet above dam. Flow of canal subtracted to obtain flow over dam during irrigation season.

CHANNEL AND CONTROL.—Banks high and not subject to overflow. Concrete diversion works for St. Mary Canal form control.

63479-28--2

EXTREMES OF DISCHARGE.—Maximum discharge, 2,790 second-feet May 19 (includes discharge of the canal); minimum stage, 0.30 foot January 1-22 (discharge, 86 second-feet).

1902-1924: Maximum stage recorded, estimated at 9.4 feet June 5, 1908 (discharge, 7,980 second-feet); minimum discharge, 30 second-feet April 3-7, 1904.

ICE.—Stage-discharge relation seriously affected by ice.

DIVERSIONS.—Intake for United States Bureau of Reclamation canal located at left end of diversion dam. Tables of daily and monthly discharge include the discharge of St. Mary Canal.

REGULATION.—Natural storage in St. Mary Lake. Swiftcurrent Creek is diverted into St. Mary Lake, and the flow is regulated by gate operations at Sherburne Lake Reservoir.

Accuracy.—Stage-discharge relation probably permanent; affected by ice February 18 to March 31. Rating curve well defined above 300 second-feet. Daily gage height obtained from graph of water-stage recorder October 1 to 29; May 1 to September 30. Staff gage readings to hundredths once daily used October 30 to April 30. Daily discharge ascertained by applying daily gage height to rating table and adding flow in canal for days during which canal was in operation. Records good.

The diversion dam below the gaging station was constructed by the United States Bureau of Reclamation for the purpose of diverting water from St. Mary River into St. Mary Canal, which carries the water across the divide into North Fork of Milk River. The water then flows in the channel of Milk River through Canada and is finally used for irrigation in the Milk River Valley in Montana. The present capacity of the diversion canal is about 600 second-feet. A storage reservoir is provided on Swiftcurrent Creek by a dam at the outlet of Sherburne Lake. By means of a diversion channel connecting Swiftcurrent Creek and Lower St. Mary Lake, the run-off from Swiftcurrent Creek is made available for diversion through St. Mary Canal.

Discharge measurements of St. Mary River near Babb, Mont., during the year ending September 30, 1924

### ST. MARY RIVER NEAR KIMBALL, ALBERTA

- LOCATION.—In SW. 1/4 sec. 25, T. 1 N., R. 25 W. fourth meridian, 1 mile south and 1 mile west of Kimball, Alberta, and 5 miles north of international boundary.
- Drainage area.—472 square miles (measured on topographic map).
- RECORDS AVAILABLE.—January 1, 1913, to September 30, 1924. September 1, 1902, to December 31, 1912, records were obtained at point half a mile north of boundary line. Records were also obtained by the irrigation branch, Department of Interior, Canada, at a point half a mile below present station, from 1905 to 1912. Discharge at the three points practically the same.
- GAGE.—Stevens continuous water-stage recorder on right bank used during open-water season. During winter chain gage on highway bridge 3 miles below station. Gages to different data. Read by W. Nicolls.
- DISCHARGE MEASUREMENTS.—Made from cable 1,200 feet above gage or by wading.
- Channel and control.—Bed of stream at gage and at control is composed of boulders and sandstone ledges. Control formed by an outcropping ledge

of sandstone covered with boulders near left bank; subject to occasional shifts.

Extremes of discharge.—Maximum stage recorded during year, 5.25 feet at 11.30 a. m. June 17 (discharge, 3,030 second-feet); minimum discharge, 82 second-feet January 5 (stage-discharge relation affected by ice).

1902-1924: Maximum discharge, 18,000 second-feet June 5, 1908 (estimated by comparison with record for station near Babb); minimum discharge, 46 second-feet December 1, 1919 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation affected by ice.

DIVERSIONS.—St. Mary Canal diverts water from St. Mary River near Babb, Mont., to North Fork of Milk River. Alberta Railway & Irrigation Co.'s canal diverts from St. Mary River 2 miles below station.

REGULATION.—Flow of Swiftcurrent Creek regulated by Sherburne Lake Reservoir.

Accuracy.—Stage-discharge relation not permanent; affected by ice November 20 to April 6. Rating curves well defined. Operation of water-stage recorder satisfactory October 1 to November 19 and April 17 to September 30. Chain gage read to hundredths once or twice daily November 20 to April 16. Shifting-control method used July 7 to September 20. Daily discharge determined by applying to rating table mean daily gage height and, if necessary, proper correction for ice and shifting control. Records for open channel good; winter records fair.

Cooperation.—Maintained in cooperation with Department of Interior, Canada.

### ST. MARY CANAL AT INTAKE, NEAR BABB, MONT.

Locarion.—In NW. ¼ sec. 27, T. 36 N., R. 14 W., 600 feet below intake of canal on Blackfeet Indian Reservation, 1 mile east of Babb, Glacier County.

RECORDS AVAILABLE.—June 1, 1918, to September 30, 1924.

GAGE.—Gurley printing water-stage recorder on right bank, installed April 17, 1919; inspected by ditch rider of canal.

DISCHARGE MEASUREMENTS.—Made from cable near gage.

Accuracy.—Stage-discharge relation permanent during period. Rating curve well defined above 40 second-feet. Gage read to hundredths once or twice daily. Operation of water-stage recorder unsatisfactory and used only as observer's check. Daily discharge ascertained by applying mean daily gage height to rating table, except September 11 when discharge was interpolated. Records fair.

Cooperation.—Station maintained in cooperation with Department of Interior, Canada.

St. Mary Canal diverts water from west bank of St. Mary River, near Babb, Mont., and discharges into North Fork of Milk River. The water then flows in the natural channel of Milk River through Canada and is finally used for irrigation in Milk River Valley east of Havre, Mont. Water may be returned to St. Mary River at St. Mary crossing.

### ST. MARY CANAL AT ST. MARY CROSSING, NEAR BABB, MONT.

LOCATION.—In NE. 1/4 sec. 30, T. 37 N., R. 13 W. Montana meridian, 500 feet east of outlet of St. Mary River siphon, 10 miles below intake and 9 miles north of Babb, Glacier County.

RECORDS AVAILABLE.—July 6, 1918, to September 30, 1924 (irrigation seasons only).

GAGE.—Stevens continuous water-stage recorder on left bank.

DISCHARGE MEASUREMENTS.—Made from cable near gage.

CHANNEL AND CONTROL.—Control is located at entrance of steel flumes. May shift due to silting of canal.

ACCURACY.—Stage-discharge relation probably permanent during period. Rating curve well defined above 20 second-feet. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

Cooperation.—Data collected and compiled jointly with Department of Interior, Canada.

### ST. MARY CANAL AT HUDSON BAY DIVIDE, NEAR BROWNING MONT.

LOCATION.—In sec. 5, T. 37 N., R. 11 W., 3 miles above canal outlet, 30 miles north of Browning, Glacier County, on Blackfeet Indian Reservation.

RECORDS AVAILABLE.—July 3, 1917, to September 30, 1924 (irrigation seasons

only).

Gage.—Stevens continuous water-stage recorder on right bank 50 feet above first drop in canal.

DISCHARGE MEASUREMENTS.—Made from cable 500 feet above gage.

CHANNEL AND CONTROL.—Canal uniform in section. Control is V-shaped notch in concrete drop just below gage.

ACCURACY.—Stage-discharge relation permanent during period. Rating curve well defined above 30 second-feet. Operation of water-stage recorder satisfactory except as indicated in footnote to daily-discharge table. Daily discharge ascertained by applying mean daily gage height to rating table, except May 5, 10, and September 13, when discharge was determined by hourly method. Records good.

Cooperation.—Data collected and compiled jointly with Department of Interior Canada.

### SWIFTCURRENT CREEK AT MANY GLACIER, MONT.

LOCATION.—In sec. 12, T. 35 N., R. 16 W., at outlet of McDermott Lake at Many Glacier, Glacier County, in Glacier National Park, 14 miles southwest of Babb.

Drainage area.—31.4 square miles (measured on topographic map).

RECORDS AVAILABLE.—June 6, 1912, to September 30, 1924 (irrigation seasons only).

Gage.—Stevens continuous water-stage recorder on right bank installed June 15 1918; inspected by C. N. McGillis and others.

DISCHARGE MEASUREMENTS.—Made from cable 1,000 feet below gage or by wading. CHANNEL AND CONTROL.—Limestone outcrop at outlet of lake forms control; shifts slightly.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.00 feet at 2 p. m. May 16 (discharge, 771 second-feet); minimum stage during period 1.40 feet March 29 to April 5 (discharge, 13 second-feet).

1912-1924: Maximum stage recorded, 4.75 feet June 17, 1916 (discharge, 1,550 second-feet); minimum stage, 1.22 feet November 6-7, 1921 (discharge, 10 second-feet).

ICE.—Not operated during winter.

DIVERSIONS.—None. REGULATION.—None.

Accuracy.—Stage-discharge relation changed slightly during winter. Rating curves well defined between 35 and 700 second-feet. Operation of water-stage recorder satisfactory except as indicated in footnote to daily discharge table. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

Cooperation.—Data collected and compiled jointly with Department of Interior, Canada.

### SWIFTCURRENT CREEK AT SHERBURNE, MONT.

Location.—In sec. 35, T. 36 N., R. 15 W., 800 feet below spillway of Sherburne Lake dam at Sherburne, Glacier County.

Drainage area.—64 square miles (measured on topographic map).

RECORDS AVAILABLE.—July 1, 1912, to September 30, 1924.

Gage.—Stevens continuous water-stage recorder on left bank, installed May 18, 1921.

DISCHARGE MEASUREMENTS.—Made by wading or from cable 450 feet above gage. Channel and control.—An outcropping limestone ledge, somewhat broken and irregular, forms control; subject to slight shifts.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.28 feet July 19 (discharge, 857 second-feet); minimum stage, 0.77 foot at 11 a.m. May 27 (discharge, 10.7 second-feet).

1912-1924: Maximum stage recorded, 7.85 feet June 17, 1916 (discharge, 2,280 second-feet); minimum discharge, no flow when gates were closed for several periods in 1918, 1919, 1920, 1921, and 1923.

DIVERSIONS.-None.

REGULATION.—Flow regulated by gate operations.

Accuracy.—Stage-discharge relation changed slightly during winter. Rating curves well defined. Gage heights determined from graph of water-stage recorder October 1-31, May 1 to June 30, July 5-15, and July 18 to September 30. Observer's readings on staff gage to hundredths for intervening days. Daily discharge determined by hourly method October 8, 14-17, 19-21, May 19, 21, June 17, 19, 24, 28, August 23-24, 26, and September 10. Daily discharge determined by applying mean daily gage height to rating table for remainder of records. Records fair.

COOPERATION.—Data collected and compiled jointly with the Department of Interior, Canada.

### CANYON CREEK NEAR MANY GLACIER, MONT.

LOCATION.—At edge of heavy timber area half a mile above mouth, in Glacier National Park, and 2 miles southeast of Many Glacier, Glacier County. Drainage area.—7 square miles (measured on topographic map).

RECORDS AVAILABLE.—July 12, 1918, to September 30, 1924

GAGE.—Stevens continuous water-stage recorder on left bank.

DISCHARGE MEASUREMENTS.—Made from footbridge at gage or by wading.

CHANNEL AND CONTROL.—Bed of large boulders and cobblestones. Banks high and are not overflowed. Control is riffle 20 feet below gage; subject to shifts.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 1.97 feet at 2 a. m. June 15 (discharge, 145 second-feet); minimum stage, 0.66 foot at 10 a. m. October 16 (discharge, 7.7 second-feet).

1918-1924: Maximum stage, 3.34 feet May 16, 1922 (discharge, estimated 500 second-feet); minimum stage, 0.56 foot October 4, 1919 (discharge. 3.3 second-feet).

Ice.—Station not operated during winter.

DIVERSIONS.—None.

REGULATION.—Some natural storage in small lake at head of creek.

Accuracy.—Stage-discharge relation changed slightly during winter or during spring break-up. Rating curves fairly well defined. Operation of water-stage recorder satisfactory except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying mean daily gage height to rating table. Records good, except for period of estimated discharge, for which they are fair.

COOPERATION.—Maintained in cooperation with Department of Interior, Canada,

### RED RIVER AT FARGO, N. DAK.

LOCATION.—In sec. 7, T. 139 N., R. 48 W., at Island Park Dam, half a mile above highway bridge connecting Front Street, Fargo, Cass County, N. Dak., with Moorhead, Minn., and 10 miles above confluence with Sheyenne River.

Drainage area.—6,420 square miles (revised).

RECORDS AVAILABLE. - May 27, 1901, to September 30, 1924.

GAGES.—Vertical staff attached to piling at upper end of fishway, left end of dam. Auxiliary gages for high stages on bank adjoining. Gage read by city engineer.

DISCHARGE MEASUREMENTS.—Made from footbridge above dam or from Front Street Bridge.

Channel and control.—Bed of clay and silt. Control is steel and timber crib dam; rock filled. Dam has slipped and changed form during past 10 years, until now the lowest point of steel crest is at gage height 0.3 foot. Control for low stage at the Front Street gage is the channel contraction at the Northern Pacific Railway bridge 200 feet below, and the obstruction there has been increasing for 10 years past. At low stage the fall over dam is now about 4 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 2.5 feet April 30 (discharge, 530 second-feet); minimum stage during period, 0.5 foot September 3 (discharge, 8 second-feet).

1901-1924: Maximum open-water stage recorded, 17.34 feet at 3 p. m. July 11, 1916, discharge, 7,740 second-feet; minimum stage, 0.5 foot September 3, 1924 (discharge, 8 second-feet).

ICE.—Stage-discharge relation affected by ice.

DIVERSIONS.—None.

REGULATION.—None.

Accuracy.—Stage-discharge relation changed during winter, caused by repairing dam. Rating curves well defined. Staff gage read to tenths or occasionally to half-tenths once daily except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

COOPERATION.—Gage-height record furnished by city engineer of Fargo.

Discharge measurements of Red River at Fargo, N. Dak., during the year ending September 30, 1924

### RED RIVER AT GRAND FORKS. N. DAK.

LOCATION.—In sec. 3, T. 151 N., R. 50 W., at Northern Pacific Railway bridge between Grand Forks, Grand Forks County, N. Dak., and East Grand Forks, Minn., half a mile below mouth of Red Lake River.

Drainage area.—25,500 square miles (revised).

RECORDS AVAILABLE.—May 28, 1901, to September 30, 1924; at same point gage-height records were kept from 1882 to 1901 by the United States Engineer Corps, and a few discharge measurements made by them.

Gage.—Vertical staff attached to ice breaker below center pier of bridge; read by Alex Slattery and Harold Bowes.

DISCHARGE MEASUREMENTS.—Made from Great Northern Railway bridge one-fourth mile above gage or from Demers Avenue Bridge.

CHANNEL AND CONTROL.—Clay and silt; shifts occasionally.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.2 feet May 2 (discharge, 2,530 second-feet); minimum stage, 2.2 feet September 9 (discharge, 189 second-feet); minimum discharge, about 174 second-feet January 28 (stage-discharge relation affected by ice).

1882-1924: Maximum stage recorded, 50.2 feet April 10, 1897 (discharge, 43,000 second-feet); minimum discharge, about 100 second-feet during early part of February, 1912 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation seriously affected by ice.

DIVERSIONS .-- None.

REGULATIONS .- None.

Accuracy.—Stage-discharge relation changed slightly during winter; affected by ice December 1 to April 4. Rating curves fairly well defined. Gage read to tenths twice weekly during January, February, and March, and daily during remainder of year. Daily discharge ascertained by applying rating table to daily gage height. Discharge for days of missing gage height estimated. Records fair.

Discharge measurements of Red River at Grand Forks, N. Dak., during the year ending September 30, 1924

### MUSTINKA RIVER ABOVE WHEATON MINN.

LOCATION.—On line between secs. 7 and 8, T. 127 N., R. 46 W., 1 mile above Chicago, Milwaukee & St. Paul Railway bridge, 1½ miles northeast o Wheaton, Traverse County, and 8 miles above Lake Traverse into which river discharges.

Drainage area.—776 square miles.

RECORDS AVAILABLE.—March 23 to September 30, 1917; June 25, 1919, to September 30, 1924. June 7 to September 30, 1916, at a point 3½ miles downstream.

GAGE.—Chain gage attached to bridge; read by Vernon Heggen. Staff gage at railway bridge for convenient comparison.

DISCHARGE MEASUREMENTS.—Made from highway bridge near Chicago, Milwaykee & St. Paul Railway bridge, from highway bridge at chain gage, from highway bridge midway between them or by wading.

CHANNEL AND CONTROL.—Bed dredged in or near hardpan; practically permanent. Slope of river from lowest stage at gage to ordinary stage of Lake Traverse is only about 5 feet, so that at rare intervals flood stage in lake may affect stage at gage.

EXTREMES OF DISCHARGE.—Maximum stage during year, 2.65 feet April 5. (discharge, 45 second-feet); no flow during first half of October.

1917; 1919-1924: Maximum stage recorded, 14.7 feet April 1, 1917 (discharge, about 2,340 second-feet); no flow August 28-31, September 30, August 17-19, October 1-15 1923.

Ice.—Stage-discharge relation seriously affected by ice.

Accuracy.—Stage-discharge relation probably permanent. Rating curve well defined. Gage read to hundredths once daily except as explained in footnote to daily-discharge table. Daily discharge ascertained by applying daily gage height to rating table. Open-water records good; winter estimates probably fair.

The following discharge measurements were made:

April 17, 1924: Gage height, 1.75 feet; discharge, 5.6 second-feet.

August 12, 1924: Gage height, 1.31 feet; discharge, 0.1 second-foot.

Daily discharge, in second-feet, of Mustinka River above Wheaton, Minn., for the year ending September 30, 1924

### RED LAKE RIVER AT THIEF RIVER FALLS, MINN.

LOCATION.—In sec. 33, T. 154 N., 43 W. one-third mile below dam at Thief River Falls, Pennington County, and 1 mile below mouth of Thief River. Drainage area.—3,430 square miles.

RECORDS AVAILABLE. —July 1, 1909, to September 30, 1918, and March 25, 1920, to September 30, 1924.

GAGE.—Inclined staff gage on right bank, installed August 19, 1920; read by Thomas Hastad.

DISCHARGE MEASUREMENTS.—Made from cable near gage or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel and small boulders; practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, 5.6 feet April 20 (discharge, 845 second-feet); minimum discharge, estimated 7 second-feet April 6 (stage-discharge relation affected by ice.

1909-1918; 1920-1924: Maximum open-water stage recorded 12.2 feet April 19-21, 1916 (discharge, 7,040 second-feet); minimum discharge, no flow July 17 and August 27, 1911; caused by regulation.

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.—A short distance above station is a dam owned by Hanson & Barzen Milling Co. and city lighting plant. The variation in load on the turbines due to operation of lighting plant (at, night) and of the mill (chiefly during day) causes fluctuations in stage at gage.

Accuracy.—Stage-discharge relation not permanent; affected by ice during winter. Rating curves well defined. Gage read to half-tenths once daily except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying daily gage height to rating table. Open-water records at medium and high stages good; at low stages diurnal fluctuation due to operation of power plants above station impairs accuracy of mean gage height and results only fair. Winter records poor.

### RED LAKE RIVER AT CROOKSTON, MINN.

LOCATION.—In sec. 30, T. 150 N., R. 46 W., at Sampson's Addition steel highway bridge in Crookston, Polk County, one-fourth mile below dam and power house of Crookston Light, Water & Power Co. No tributaries enter within several miles.

Drainage area.—5,320 square miles.

RECORDS AVAILABLE.—May 19, 1901, to September 30, 1924.

GAGE.—Chain gage attached to middle span of highway bridge; installed July 1 1909; read by J. A. McLean.

DISCHARGE MEASUREMENTS:-Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of silt, gravel, and small boulders; control not well defined. One channel at all stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.1 feet April 23 and May 19 (discharge, 1,090 second-feet); minimum stage, 2.5 feet September 23 and 30 (discharge, 30 second-feet).

1901-1924: Maximum discharge recorded, 14,700 second-feet, July 5, 1919; minimum discharge, 10 second-feet, by discharge measurement January 27, 1912, but the flow is controlled to such an extent that minimum discharge has no bearing on minimum natural flow.

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.—Diurnal fluctuation in stage, particularly at low water, is caused by operation of power mant immediately above station and by another 8 miles above. Storage at these plants is small, so that mean monthly flow should represent nearly natural flow.

Accuracy.—Stage-discharge relation not permanent; affected by ice during greater part of winter and by growth of vegetation in channel. Standard rating curve well defined. Gage read to tenths once daily except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying daily gage height to rating table. At low stages mean daily gage height may be considerably in error on account of regulation. Shifting-control method used October 1–10 and June 5 to September 30. Open-water records probably fair; winter records poor.

Note.—No gage reading Jan. 9 to Mar. 26 and only an occasional reading Nov. 1 to Jan. 8. Mean discharge from November to March estimated from precipitation and temperature records and comparison with records for adjacent streams. Gage not read October 28, 27, 31, June 7, 19, 21, and July 4; discharge interpolated. July 3 to Aug. 2 power plant above gage was run only about 4 hours each evening and Aug. 3-26 about 2 hours each evening. This operation resulted in gage readings being systematically too low to represent mean daily discharge, and, to correct for this error, 100 second-feet has been added to daily discharge July 3 to Aug. 2 and 50 second-feet Aug. 3-26.

### THIEF RIVER NEAR THIEF RIVER FALLS, MINN.

Location.—In sec. 3, T. 154 N., R. 43 W., 1,000 feet above steel highway bridge in Marshall County, 5 miles north of Thief River Falls, Pennington County, and 5 miles above mouth of river.

Drainage area.—1,010 square miles.

RECORDS AVAILABLE.—July 1, 1909, to September 30, 1917; April 1, 1920, to September 30, 1921; October 1, 1923, to September 30, 1924.

GAGE.—Chain gage on cantilever timber fastened to a tree on right bank; read by Margaret Hillyer.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of heavy gravel and boulders; practically permanent. One channel at all stages. Banks high and not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.25 feet April 20 and 21 (discharge, 132 second-feet); minimum stage, 3.5 feet September 5-30 (discharge, 0.1 second-foot.)

1909-1917; 1920-1921; 1923-1924: Maximum stage recorded, 14.5 feet April 23, 1916 (discharge, 4,080 second-feet); no flow October 1, 1910, to March 12, 1911, August 2-13, 22-26, September 1-3, 5-12, 14-18, 1911, November 10, 1911, to March 26, 1912, and November 16-21, 1920.

Flood of July, 1919, reached a stage of about 16.3 feet (discharge, about 4,900 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—None.

Accuracy.—Stage-discharge relation practically permanent, except as affected by ice. Rating curve well defined below 3,800 second-feet. Gage read to half-tenths once daily except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

The following discharge measurements were made:

April 19, 1924: Gage height, 4.82 feet; discharge, 52 second-feet. June 17, 1924: Gage height, 4.56 feet; discharge, 20 second-feet. September 3, 1924: Gage height, 3.58 feet; discharge, 0.1 second-foot.

Daily discharge, in second-feet, of Thief River near Thief River Falls, Minn., for the year ending September 30, 1924

#### PEMBINA RIVER AT NECHE, N. DAK.

LOCATION.—In sec. 36, T. 164 N., R. 54 W. at Great Northern Railway bridge, one-third of a mile above Great Northern Railway dam, and two-thirds mile north of Neche, Pembina County.

Drainage area.—2,960 square miles (revised).

RECORDS AVAILABLE.—May 1, 1903, to September 30, 1915; April 1, 1919, to September 30, 1924.

Gage.—Vertical staff bolted to concrete abutment at north end of railway bridge; read by P. J. Horgan.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of clay and silt, nearly permanent.

Control is loose rock dam 4 feet high, one-third mile below gage; shifts occasionally.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.7 feet April 20 (discharge, 674 second-feet); minimum open-water stage, 3.1 feet several days in September (discharge, 3 second-feet);

1903-1915; 1919-1924: Maximum discharge recorded, 3,870 second-feet May 2, 1904 (gage-height, 20.9 feet); minimum stage, 1.3 feet several days in September, 1911 (discharge, 1.0 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Water is raised at low stages from 1 to 3 feet at gage by loose rock dam 4 feet high one-third mile below, constructed to give sufficient depth of water for the intake of Great Northern Railway water tank. There is considerable leakage through dam, and no permanent determination of the effect of dam can be made because its crest is sometimes somewhat changed by the ice-run or spring floods. There are no reservoirs or power plants that affect flow.

Accuracy.—Stage-discharge relation changed during winter; affected by ice January 1 to March 26. Rating curves fairly well defined. Gage read to tenths once daily during period except November 25-30. Daily discharge ascertained by applying rating table to daily gage height. Discharge November 25-30 estimated. Records fair.

The following discharge measurements were made:

April 22, 1924: Gage height, 4.93 feet; discharge, 282 second-feet. August 1, 1924: Gage height, 3.57 feet; discharge, 27.5 second-feet.

August 2, 1924: Gage height, 3.54 feet; discharge, 20 second-feet.

Daily discharge, in second-feet, of Pembina River at Neche, N. Dak., for the year ending September 30, 1924

#### ROSEAU RIVER AT CARIBOU, MINN.

LOCATION.—In sec. 34, T. 164 N., R. 45 W. at highway bridge at Caribou, Kittson County, 1 mile south of international boundary and 3 miles above crossing of boundary line by river.

Drainage area.—1,650 square miles (revised).

RECORDS AVAILABLE.—April 1 to October 6, 1917; April 12, 1920, to September 30, 1924.

Gage.—Chain gage fastened to downstream handrail of bridge, 60 feet from left abutment; read by James A. McKibbin.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Channel is artificial, of trapezoidal cross-section, about 100 feet wide and 10 feet deep. Bed composed of hardpan with a few scattered large boulders.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.9 feet April 29 (discharge, 1,230 second-feet); minimum discharge probably occurred in January.

1917; 1920–1924: Maximum stage recorded, 12.5 feet May 1 and 2, 1923, (discharge, 2,980 second-feet); minimum discharge, 4 second-feet, September 10–12, 29, 30, 1917.

Ice.—Stage-discharge relation seriously affected by ice.

DIVERSIONS.—No diversions involving storage or loss of water. A small channel 3½ miles long was dredged some years ago from a point 4 miles above station to a point 1 mile below station. At all stages above approximately 6 feet, water flows in this channel and is measured and included with all measurements of main channel.

REGULATION.—None.

Accuracy.—Stage-discharge relation practically permanent. Rating curve well defined. Gage read to half-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except as indicated in footnote to daily-discharge table. Open-water records good; winter estimates poor.

The following discharge measurements were made:

October 21, 1923: Gage height, 3.73 feet; discharge, 55 second-feet.

June 18, 1924: Gage height, 4.39 feet; discharge, 149 second-feet.

September 4, 1924: Gage height, 3.66 feet; discharge, 50 second-feet.

Daily discharge, in second-feet, of Roseau River at Caribou, Minn., for the year ending September 30, 1924

<sup>·</sup> Estimated.

#### MOUSE RIVER AT MINOT, N. DAK.

LOCATION.—At Anne Street footbridge, northeast of Great Northern Railway roundhouse, at Minot, Ward County.

Drainage area.—10,270 square miles (revised).

RECORDS AVAILABLE.—May 5, 1903, to March 31, 1924, when station was discontinued.

GAGE.—Vertical staff in several sections attached to pier of bridge; read by Ephraim Cox.

DISCHARGE MEASUREMENTS.—Made from Anne Street Bridge, North Street Bridge, South Sixth Street Bridge, or by wading.

CHANNEL AND CONTROL.—Channel is clay and silt, nearly permanent, but changed somewhat in recent years by the constructions encroaching into the channel through the city. The usual control has been a 5-foot dam of timbers and loose rock 1 mile below gage, at the Soo Railway water tank intake, which raises water at gage at low stages about 3 feet when the water is exactly at crest of dam. When flow is less than 5 second-feet, the leakage allows the water level to fall below crest. During the winter of 1922–23, the city park board completed a 10-foot concrete dam 4½ miles below gage, the crest of which is at the same elevation as the 9.07-foot point of Anne Street gage; during flood stages this affects the height at the gage unless the Taintor gate is closed.

EXTREMES OF DISCHARGE.—Maximum stage recorded during period, 6.3 feet March 23 (stage-discharge relation affected by ice, discharge 281 second-feet); minimum stage, 3.8 feet February 23 (discharge, 0.7 second-foot).

1903-1924: Maximum stage recorded, 21.9 feet April 20, 1904 (discharge, estimated 12,000 second-feet); minimum stage, 1.8 feet February 28, 1913 (discharge, 0.1 second-foot).

ICE.—Stage-discharge relation affected by ice.

DIVERSIONS.—None.

REGULATION.—No regulation above gage. Dam at Minneapolis, St. Paul, and Sault St. Marie raised the water at gage about 5 feet at ordinary low stage. This dam, designed to give enough depth of water for the intake pipe, has no sluices and is not tight, and water falls below level of crest when discharge is less than 6 second-feet. The new city park dam will cause backwater when the Taintor gate is closed.

Accuracy.—Stage-dischage relation probably permanent during year; affected by ice March 19-31 and by backwater from city park dam October 1-15. Rating curve fairly well defined. Gage read to tenths once daily October 1 to

November 24 and March 15-31; once a week for intervening period. Daily discharge ascertained by applying daily gage height to rating table. Records probably fair.

The following discharge measurements were made:

March 8, 1924: Gage height, 4.62 feet; discharge, 52 second-feet.

June 25, 1924: Gage height, 6.00 feet; discharge, 241 second-feet.

Daily discharge, in second-feet, of Mouse River at Minot, N. Dak., for the period October 1, 1923, to March 31, 1924

#### UPPER MISSISSIPPI RIVER BASIN

#### MISSISSIPPI RIVER NEAR ROYALTON, MINN.

LOCATION.—In sec. 8, T. 127 N., R. 29 W. at highway bridge 3 miles west of Royalton, Morrison County, and 7 miles below mouth of Swan River.

Drainage area.—11,600 square miles.

RECORDS AVAILABLE.—March 8 to September 30, 1924.

GAGE.—Au water-stage recorder installed March 8, 1924, just below right end of bridge.

CHANNEL AND CONTROL.—Bed composed of sand and gravel with some boulders.

Control not well defined; shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during period, 9.02 feet at 3 a. m. August 7 (discharge, 7,640 second-feet); minimum stage, 6.20 feet at 11 a. m. July 14 (discharge, 910 second-feet).

REGULATION.—Little Falls Dam, 8 miles upstream, produces a systematic diurnal fluctuation at gage. During period of these records there is being constructed a dam 3 miles upstream but no material regulation of flow at this dam occurred prior to September 30. Flow of river is controlled by Government reservoirs on upper river for purpose of increasing low-water open-season flow in the interests of navigation.

Accuracy.—Stage-discharge relation changed during summer. Rating curves fairly well defined. Operation of water-stage recorder satisfactory except as noted in footnote to daily-discharge table. Daily discharge ascertained by applying to rating table mean daily gage height as determined from recorder charts by inspection. Records poor.

Cooperation.—Expense of installing and maintaining station paid by Pike Rapids Power Co.

## MISSISSIPPI RIVER AT ELK RIVER, MINN.

Location.—In sec. 3, T. 121 N., R. 23 W., at highway bridge in Elk River, Sherburne County, 2,500 feet below mouth of Elk River.

Drainage area.—14,500 square miles.

RECORDS AVAILABLE.—July 22, 1915, to September 30, 1924.

GAGE.—Chain gage bolted to handrail of bridge, downstream side near right bank; read by W. H. Ebner.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Bed composed of sand and gravel. Banks high and not subject to overflow. Control poorly defined.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.60 feet at 5.30 p. m. August 7 (discharge, 6,400 second-feet); minimum discharge, estimated 1,250 second-feet January 20, February 9, and March 9 (stage-discharge relation affected by ice).

1915–1924: Maximum open-water stage recorded, 10.8 feet April 7, 1916 (discharge, 27,000 second-feet); minimum discharge same as for 1924.

Maximum discharge probably occurred on April 5, 1917, and has been estimated at about 34,000 second-feet from records of discharge at Coon Rapids power plant.

ICE.—Stage-discharge-relation seriously affected by ice.

REGULATION.—Nearest dam above station is at St. Cloud 40 miles upstream. An observed systematic diurnal fluctuation at the gage of about 0.1 foot is doubtless due to regulation at St. Cloud, but most of the effect of regulation is eliminated before reaching station. Flow of river is controlled by Government dams on upper river for the purpose of increasing the low-water open-season flow in the interests of navigation. Daily and monthly discharge somewhat affected by regulation but yearly discharge represents very nearly the natural flow.

Accuracy.—Stage-discharge relation permanent except as affected by ice. Rating curve well defined above 2,000 second-feet and extended below. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except as indicated in footnote to table of daily discharge. Open-water records excellent; winter records fair.

Cooperation.—Gage records furnished by United States Engineer Corps.

The following discharge measurement was made: June 17, 1924: Gage height, 3.27 feet; discharge, 2,990 second-feet.

Daily discharge, in second-feet, of Mississippi River at Elk River, Minn., for the year ending September 30, 1924

#### MISSISSIPPI RIVER AT ST. PAUL, MINN.

LOCATION.—At Chicago Great Western Railroad bridge near foot of Robert Street, St. Paul, Ramsay County, 6 miles below mouth of Minnesota River.

Drainage area.—35,700 square miles.

RECORDS AVAILABLE.—March 22, 1887, to September 30, 1924. Observation of stage was begun in 1873 by United States Signal Service and continued by United States Weather Bureau. Many discharge measurements made prior to 1900 by United States Engineer Corps.

GAGE.—Chain gage installed May 9, 1913, on downstream handrail of Chicago Great Western Railroad bridge; read by employee of United States Weather Bureau.

DISCHARGE MEASUREMENTS.—Made from Wabasha Street Bridge 1,000 feet above gage.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.0 feet August 26-28 (discharge, 12,900 second-feet); minimum discharge, estimated 1,850 second-feet January 20 (stage-discharge relation affected by ice). 1887-1924: Maximum stage recorded, 18.0 feet April 6, 1897 (discharge, 80,800 second-feet); minimum discharge, 1,060 second-feet February 4, 1895.

Greatest known discharge, 117,000 second-feet July 22, 1867.

CHANNEL AND CONTROL.—Channel fairly permanent. Banks moderately high; not subject to overflow. Control poorly defined.

Ice.—Stage-discharge relation seriously affected by ice.

REGULATION.—During extremely low water regulation of flow through turbines at nearest dam in Minneapolis may cause diurnal fluctuation of stage at St. Paul. Flow is regulated by Government reservoirs on headwaters at Lake Winnebigoshish, Leach Lake, Pokegama Lake, Sandy Lake, Pine River, and Gull Lake to increase low-water open-season flow in the interests of navigation, but the effect of this regulation is very gradual at St. Paul.

Accuracy.—Stage-discharge relation not permanent. Standard rating curve well defined. Gage read to tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Shifting-control method used throughout year. Open-water records fair; winter records poor.

COOPERATION.—Gage-height record furnished by United States Weather Bureau.

The following discharge measurements were made:

June 17, 1924: Gage height 0.20 foot; discharge, 4,690 second-feet.

September 9, 1924: Gage height, 0.07 foot; discharge, 4,510 second-feet.

Daily discharge, in second-feet, of Mississippi River at St. Paul, Minn., for the year ending September 30, 1924

#### MINNESOTA RIVER NEAR MONTEVIDEO, MINN.

LOCATION.—In sec. 17, T. 117 N., R. 40 W. at highway bridge 1 mile south of Montevideo, Chippewa County, and 500 feet below mouth of Chippewa River.

Drainage area.—6,300 square miles.

RECORDS AVAILABLE.—July 22, 1909, to September 30, 1924.

GAGE.—Chain gage attached to upstream handrail of bridge near left bank; read by Elizabeth Hendricks.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

CHANNEL AND CONTROL.—Bed composed of heavy gravel and sand; fairly premanent. There is a slight riffle just below gage, but control section poorly defined. Banks fairly high but subject to overflow at stage of about 14 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.30 feet April 9 (discharge, 759 second-feet); minimum stage, 1.54 feet at 6 p. m. August 16 (discharge, 36 second-feet).

1909–1924: Maximum stage recorded, about 18.85 feet June 25, 1919 (discharge, about 22,000 second-feet); minimum discharge, 6.8 second-feet by current-meter measurement, February 9, 1912.

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.-None.

Accuracy.—Stage-discharge relation permanent. Rating curve fairly well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records fair.

The following discharge measurement was made:

June 18, 1924: Gage height, 4.34 feet; discharge, 490 second-feet.

Daily discharge, in second-feet, of Minnesota River near Montevideo, Minn., for the year ending September 30, 1924

## MINNESOTA RIVER AT MANKATO, MINN.

LOCATION.—In sec. 7, T. 108 N., R. 26 W., at Main Street highway bridge in Mankato, Blue Earth County, 2 miles below mouth of Blue Earth River. Drainage area.—14,600 square miles.

RECORDS AVAILABLE.—March 15, 1922, to September 30, 1924, at present site; May 20, 1903, to October 19, 1921, at Sibley Park 2 miles upstream. Records comparable.

Gage.—Chain gage attached to downstream side of bridge over center of left channel; read by J. J. Pihale.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Bed composed of sand and light gravel; shifts badly during high stages. Banks moderately high and not subject to overflow. Control poorly defined.

EXTREMES OF DISCHARGE.—Maximum stage recorded during period March 15 to September 30, 1922, 13.5 feet; March 16 (discharge about 9,040 second-feet); minimum stage, 3.3 feet September 16, 22-30 (discharge, 133 second-feet).

Maximum stage recorded during year ending September 30, 1923, 5.49 feet May 4 (discharge, 1,630 second-feet); minimum stage, 3.24 feet October 6, September 15, 16 (discharge, 96 second-feet).

Maximum stage recorded during year ending September 30, 1924, 7.8 feet July 2 (discharge, 3,540 second-feet); minimum stage, 3.3 feet October 5, December 2-4, 26 (discharge, 133 second-feet).

1903-1924: Maximum stage recorded, 21.2 feet at old site at Sibley Park June 26, 1908 (discharge, 43,800 second-feet); minimum discharge, 89 second-feet August 31 and September 1 and 2, 1911. Highest known stage occurred in 1881 and is shown in Mankato by a well-marked line, which was approximately 27 feet above the zero of Sibley Park gage. This stage is corroborated by M. B. Haynes, city engineer of Mankato, who states that high water occurred after ice went out and was not caused by back water. The corresponding discharge was estimated at 65,000 second-feet. ICE.—Stage-discharge relation affected by ice.

REGULATION.—Nearest dam is at Minnesota Falls, 140 miles upstream. A dam on Blue Earth River at Rapidam, a few miles above mouth, controls the flow of that river, which is approximately 20 per cent of that at Mankato station, and produces considerable daily fluctuation at gage, amounting at times to over 1 foot.

Accuracy.—Stage-discharge relation probable permanent since gage has been installed at present site. Rating curve well defined below 5,000 second-feet and extended above. Gage read to tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair. Cooperation.—Gage-height record furnished by United States Weather Bureau.

The following discharge measurements were made:

June 20, 1924: Gage height, 4.82 feet; discharge, 1,220 second-feet.

September 10, 1924: Gage height, 4.03 feet; discharge, 567 second-feet.

Daily discharge, in second-feet, of Minnesota River at Mankato, Minn., for the years ending September 30, 1922-1924

## ST. CROIX RIVER AT SWISS, WIS.

LOCATION.—In sec. 33, T. 42 N., R. 15 W., at highway bridge near Swiss, Burnett County, 2 miles above point where St. Croix River becomes boundary line between Wisconsin and Minnesota, 10 miles northeast of Danbury, on Minneapolis, St. Paul & Sault Ste. Marie Railway. Namakagon River enters from left 3½ miles above station.

DRAINAGE AREA.—1,550 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch = 6 miles).

RECORDS AVAILABLE.—March 13, 1914, to September 30, 1924.

GAGE.—Chain gage attached to downstream side of bridge, installed May 16, 1918; read by Capt. Richard Goldschmidt.

DISCHARGE MEASUREMENTS.—Made from downstream side of bridge.

CHANNEL AND CONTROL.—Bed of gravel; smooth. Aquatic plants during summer may cause a small amount of backwater at gage. Left bank high and not subject to overflow; right bank of medium height and may possibly be overflowed during extremely high water.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.2 feet at 6.20 p. m. May 11 (discharge, 3,060 second-feet); minimum discharge, estimated 530 second-feet January 25 and 26 (stage-discharge relation affected by ice.

1914-1924: Maximum stage recorded, 6.73 feet April 22, 1916 (discharge, 8,480 second-feet); minimum discharge, estimated 530 second-feet, January 25 and 26, 1924 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation permanent except as affected by growth of grass in channel and by ice. Rating curve fairly well defined. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except for period when stage-discharge relation was affected by grass growth for which it was ascertained by indirect method for shifting channel, and for ice-affected period for which it was ascertained as indicated in footnote to table of daily discharge. Records fair-

# ST. CROIX RIVER NEAR GRANTSBURG, WIS.

LOCATION.—Near center of sec. 30, T. 40 N., R. 18 W., at Norway Point ferry, 6 miles above mouth of Kettle River and 10 miles north of Grantsburg, Burnett County. Sand Creek enters half a mile above station.

Drainage area.—2,820 square miles.

RECORDS AVAILABLE.—April 18, 1923, to September 30, 1924.

GAGE.—Chain gage fastened to a cantilever arm supported by two trees just above highway and ferry site on left bank; read by Charles Panser.

DISCHARGE MEASUREMENTS.—Made from ferryboat.

Channel and control.—Bed composed of sand. Control poorly defined; apparently does not shift.

EXTREMES OF DISCHARGE.—Maximum stage recorded during period ending September 30, 1923, 7.6 feet at noon April 24 and 25 (discharge, 5,920 second-feet); minimum stage, 3.90 feet at 6 p. m. September 28 and 7 a. m. September 29 (discharge, 1,020 second-feet).

Maximum stage recorded during year ending September 30, 1924, 8.20 feet at 6 p. m. May 13 (discharge, about 7,000 second-feet); minimum discharge, estimated 800 second-feet December 31 (stage-discharge relation affected by ice)

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation permanent except as affected by ice and at times by growth of grass in channel. Rating curve fairly well defined between 920 and 5,500 second-feet and extended above and below. Gage read to half-tenths twice daily. Daily discharge ascertained by applying to rating table mean daily gage height. Open-water records good; winter records fair.

Cooperation.—Gage-height records and results of seven discharge measurements furnished by Northern States Power Co.

Discharge measurements of St. Croix River near Grantsburg, Wis., during the years ending September 30, 1923 and 1924

<sup>•</sup> Estimated.

#### ST. CROIX RIVER NEAR RUSH CITY, MINN.

Location.—In SW. ¼ sec. 8, T. 37 N., R. 20 W., at Northern Pacific Railway bridge 5 miles east of Rush City, Chisago County, and 10 miles below mouth of Snake River.

Drainage area.—5,120 square miles.

RECORDS AVAILABLE.—April 18, 1923, to September 30, 1924.

Gage.—Chain gage attached to downstream side of railroad bridge near right end; read by Ludwig Lelander.

DISCHARGE MEASUREMENTS.—Made from downstream side of railroad bridge.

CHANNEL AND CONTROL.—Bed composed of sand and silt; not permanent. Control poorly defined. Aquatic plants during summer cause backwater.

EXTREMES OF DISCHARGE.—Maximum stage recorded during period ending September 30, 1923, 5.4 feet April 24 and 25 (discharge, 10,600 second-feet); minimum discharge, 1,210 second-feet, September 4-30.

Maximum stage recorded during year ending September 30, 1924, 6.3 feet May 14 and 15 (discharge about 13,700 second-feet); minimum discharge, 880 second-feet October 2 and 3.

Accuracy.—Stage-discharge relation not permanent. Rating curve fairly well defined between 1,800 and 11,000 second-feet. Gage read to half-tenths twice daily. Daily discharge ascertained by applying to rating table mean daily gage height. Aquatic growth obstructed channel and caused backwater during a part of summer and fall of 1923 and 1924. Discharge for these periods ascertained by indirect method for shifting channel. Openwater records fair; winter records poor.

Cooperation.—Gage-height record and results of six measurements furnished by Northern States Power Co.

Discharge measurements of St. Croix River near Rush City, Minn., during the years ending September 30, 1923 and 1924

#### ST. CROIX RIVER NEAR ST. CROIX FALLS, WIS.

- LOCATION.—In W. ½ sec. 18, T. 34 N., R. 18 W., at power plant of Northern States Power Co., on Wisconsin side of St. Croix River near St. Croix Falls, Polk County.
- Drainage area. -5,930 square miles.
- RECORDS AVAILABLE.—January 1, 1910, to September 30, 1924. Discharge measurements for 1903 published in Water-Supply Paper 98, under St. Croix River near Taylors Falls, Minn. Records from January 10, 1902, to December, 1909, published in "Report of water resources investigation of Minnesota, 1909—1912" by Minnesota State Drainage Commission.
- DISCHARGE.—Determinations of discharge based on kilowatt output of dynamo and exciters plus flow over dam and spillway considered as a weir.
- EXTREMES OF DISCHARGE.—Maximum daily discharge recorded during year, 9,800 second-feet May 15; minimum daily discharge, 595 second-feet March 2.
  - 1902-1905; 1910-1924: Maximum discharge recorded, 35,800 second-feet March 26, 1920; minimum discharge, 75 second-feet July 17, 1910 (caused by regulation).
- REGULATION.—Low-water flow controlled by operation of gates of power plant. Accuracy.—Three current-meter measurements made in June, 1924, indicate that computed discharges are from 5 to 12 per cent too low. Records probably fair.
- Cooperation.—Records of daily discharge furnished by Northern States Power Co.

Daily discharge, in second-feet, of St. Croix River near St. Croix Falls, Wis., for the year ending September 30, 1924

# NAMAKAGON RIVER AT TREGO, WIS.

Location.—In sec. 35, T. 40 N., R. 12 W., at Chicago & Northwestern Railway bridge at Trego, Washburn County, 20 miles above confluence with Totogatic River.

Drainage area.—420 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—March 11, 1914, to September 30, 1924.

GAGE.—Enameled staff gage fastened to retaining wall on left bank just above bridge; read by Patrick Lawton.

DISCHARGE MEASUREMENTS.—Made from lower chords of railroad bridge or by wading.

Channel and control.—Bed composed of coarse gravel. Banks medium high and not subject to overflow. Small island downstream with rapids on either side forms control; fairly permanent. A small amount of grass sometimes appears in channel during summer.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 2.35 feet May 13 (discharge, 838 second-feet); minimum discharge estimated 255 secondfeet January 26-29 (stage-discharge relation affected by ice).

1914-1924: Maximum stage recorded, 3.60 feet April 11, 1922 (discharge, 1,810 second-feet); minimum discharge, estimated 235 second-feet December 19, 1916 (stage-discharge relation affected by ice).

Ice.—Stage-discharge relation seriously affected by ice.

ACCURACY.—Stage-discharge relation permanent except for ice and growth of grass. Rating curve well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table except for ice-affected period. Open-water records good; winter records fair.

#### APPLE RIVER NEAR SOMERSET, WIS.

LOCATION.—In sec. 21, T. 31 N., R. 19 W., at power plant of St. Croix Power Co.,. 3½ miles below Somerset, St. Croix County, and 2 miles above mouth.

DRAINAGE AREA.—550 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—January, 1901, to September 30, 1924.

feet through gate and flashboards.

GAGE.—Vertical staff gages are used in determining head on wheel.

Determination of discharge.—This discharge through plant was determined from tables computed from data collected by a series of tests at a sharp-created weir, in September, 1920. Discharge of the turbines in second-feet, corresponding to the number of kilowatts, is determined for each hour during day from a record of the number of wheels in operation and the load. To average discharge through turbine is added leakage through the average number of wheels idle each day, the sum giving the daily flow through power house. Water is seldom wasted over spillway of dam, but when it is so wasted the quantity is computed from weir formulae and added to flow through plant. Records do not include the constant leakage of 3 second-

EXTREMES OF DISCHARGE.—Maximum daily discharge during year, 537 secondfeet April 8; minimum daily discharge, 69 second-feet July 21.

1904-1924: Maximum daily discharge recorded, 2,280 second-feet in June, 1905; minimum daily discharge, 20 second-feet June 26, 1921. Owing to regulation computed minimum discharge has no bearing on natural minimum flow.

REGULATION.—There are a number of power plants above station. The pondage of these plants is small, and though daily flow may be controlled to some extent, mean monthly flow probably represents nearly the natural flow.

Cooperation.—Records furnished by St. Paul Gas Light Co., of St. Paul, Minn., D. W. Flowers, engineer.

No discharge measurements were made during year.

Daily discharge, in second-feet, of Apple River near Somerset, Wis., for the year ending September 30, 1924

# CHIPPEWA RIVER AT BISHOP'S BRIDGE, NEAR WINTER, WIS.

LOCATION.—In sec. 23, T. 39 N., R. 6 W., at highway bridge 4 miles by road northwest of Winter, Sawyer County. East Fork of Chippewa River enters on left 3 miles above station.

Drainage area.—775 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—February 23, 1912, to September 30, 1924.

GAGE.—Chain gage fastened to bridge; installed May 23, 1916; read by William Negaard and Gladys Negaard.

DISCHARGE MEASUREMENTS.—Made from downstream side of highway bridge.

Channel and control.—Bed composed of gravel; free from vegetation; practically permanent. Control is head of rapids 1,000 feet below gage. One channel at all stages. Banks not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.6 feet at 8.45 a.m. September 14 (discharge, 2,180 second-feet); minimum stage, 3.35 feet September 20 and 21 (discharge, 20 second-feet). Both maximum and minimum stages are result of regulation and have no bearing on natural flow.

1912-1924: Maximum stage recorded, 9.56 feet April 22, 1916 (discharge, 6,940 second-feet); minimum stage, 3.28 feet May 17, 1923 (discharge, 17 second-feet).

REGULATION.—In April 1923, the Chippewa Reservoir owned by Northern States Power Co. began operations. This reservoir is located just below confluence of East and West Forks of Chippewa River 3 miles above station and has a capacity of about 10 billion cubic feet. Operation of this reservoir regulates the entire flow at station in the interest of power developments below. There is also a reservoir 16 miles above station with a capacity of 550 million cubic feet.

Ice.—Stage-discharge relation not seriously affected by ice.

Accuracy.—Stage-discharge relation permanent. Rating curve well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records excellent.

The following discharge measurement was made:

March 5, 1924: Gage height, 4.75 feet; discharge, 443 second-feet.

Daily discharge, in second-feet, of Chippewa River at Bishop's Bridge, near Winter, Wis., for the year ending September 30, 1924

# CHIPPEWA RIVER NEAR BRUCE, WIS.

LOCATION.—In sec. 4, T. 35 N., R. 7 W., at Minneapolis, St. Paul & Sault Ste.

Marie Railway bridge 1 mile east of Bruce, Rusk County. Thornapple
River enters from left immediately above station, and Flambeau River from
left 21 miles below.

63479-28---5

Drainage area.—1,600 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—December 31, 1913, to September 30, 1924.

Gage.—Chain gage attached to downstream side of bridge; read by M. Pavlak. Discharge measurements.—Made from downstream side of bridge.

CHANNEL AND CONTROL.—Bed composed of sand and small gravel; free from vegetation. First and second channels from west fairly permanent; third channel nearest east bank has a tendency to fill with sand deposited by Thornapple River. Flow except during extremely high stages is confined within banks.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 10.5 feet at 8 a. m. April 26 (discharge, 10,600 second-feet); minimum stage, 1.45 feet September 26 and 27 (discharge, 440 second-feet).

1914–1924: Maximum stage recorded, 13.7 feet at 4.30 p. m. April 10, 1922 (discharge, 14,900 second-feet). Minimum discharge, estimated 230 second-feet March 14, 1923. (Stage-discharge relation affected by ice.)

REGULATION.—The flow at the station is quite largely controlled by reservoirs above gaging station at Bishop's Bridge. (See description of that station.)

Accuracy.—Stage-discharge relation shifted slightly during winter. Rating curve well defined. Gage read to half-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

# CHIPPEWA RIVER AT CHIPPEWA FALLS, WIS.

LOCATION.—In SE. ½ sec. 6, T. 28 N., R. 8 W., at highway bridge at Chippewa Falls, Chippewa County, 2,500 feet below mouth of Duncan Creek which enters from right.

Drainage area.—5.600 square miles.

RECORDS AVAILABLE.—June 22, 1888, to September 30, 1924.

Gage.—Gurley water-stage recorder installed July 27, 1916, on web between caisson piers supporting first right-hand span; inspected by F. M. Leslie.

DISCHARGE MEASUREMENTS.—Made from downstream side of bridge.

CHANNEL AND CONTROL.—Bed composed of heavy gravel; fairly permanent.

Banks high and seldom overflowed.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 14.4 feet at 2 p. m. April 26 (discharge, 60,000 second-feet); minimum stage, -0.58 foot at 8 p. m. January 27 (discharge, 396 second-feet). Minimum discharge was the result of regulation and does not represent natural flow.

1888-1924: Maximum stage recorded, 26.94 feet September 10, 1884; December 6, 1896, a stage of 26.03 feet was reached. It is believed that the above high stages in 1884 and 1896 were caused in part by backwater from

log jams and that the volume of discharge was considerably less than the stage would indicate if channel had been unobstructed.

Exclusive of these floods, maximum stage recorded, 17.0 feet March 27, 1920 (discharge, 78,000 second-feet); minimum discharge, approximately 40 second-feet February 4, 1917.

ICE.—Stage-discharge relation not seriously affected by ice.

REGULATION.—Flow past station controlled to a considerable extent by operation of Wissota power plant of Northern States Power Co. Large diurnal fluctuation.

In April, 1923, the reservoir on Chippewa River above Bishop's Bridge began operations; see station description for that station.

Accuracy.—Stage-discharge relation changed during year. Standard rating curve fairly well defined. Indirect method for shifting control used. Operation of water-stage recorder satisfactory except as noted in footnote to table of daily discharge. Daily discharge ascertained by means of discharge integrators. Records good.

The following discharge measurements were made:

February 1, 1924: Gage height, 1.00 foot; discharge, 3,020 second-feet.

June 16, 1924: Gage height, 1.49 feet; discharge, 3,960 second-feet.

Daily discharge, in second-feet, of Chippewa River at Chippewa Falls, Wis., for the year ending September 30, 1924

## FLAMBEAU RIVER NEAR BUTTERNUT, WIS.

LOCATION.—In lot 10, sec. 28, T. 41 N., R. 1 E., 6 miles southeast of Butternut, Ashland County, and 7 miles above Park Falls.

Drainage area.—660 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—July 30, 1914, to September 30, 1924.

Gage.—Standard chain gage supported by a built-up cantilever attached to post set in right bank, installed May 26, 1916, read by Carl G. Elm.

DISCHARGE MEASUREMENTS.—Made from cable 1,500 feet below gage.

CHANNEL AND CONTROL.—Bed at gage composed of mud and rock. Left bank low and subject to overflow; right bank slopes back gradually to high-water mark. At cable site bed is rock and banks are high. Control is at head of Schultz Rapids 1,700 feet below gage; permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.2 feet April 27-30, May 14 and 15 (discharge, 2,140 second-feet); minimum discharge, estimated 220 second-feet several days in February and March (stage-discharge relation affected by ice.

1914–1924: Maximum stage recorded, 9.0 feet April 22 and 23, 1916 (discharge, 5,430 second-feet); Minimum stage, 0.90 foot August 27 and 28, 1920 (discharge, 204 second-feet).

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.—Storage reservoirs, having an effective capacity of 1.15 billion cubic feet, are maintained by the Chippewa & Flambeau Improvement Co. on the headwaters of Flambeau River.

Accuracy.—Stage-discharge relation permanent except as affected by ice. Rating curve well defined. Gage read to quarter-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Open-water records good; winter records fair.

The following discharge measurements were made:

December 29, 1923: Gage height, 1.60 feet; discharge, 313 second-feet.

April 12, 1924: Gage height, 2.24 feet; discharge, 261 second-feet.

<sup>3</sup> Stage-discharge relation affected by ice.

Daily discharge, in second-feet, of Flambeau River near Butternut, Wis., for the year ending September 30, 1924

# FLAMBEAU RIVER NEAR LADYSMITH, WIS.

LOCATION.—In sec. 35, T. 36 N., R. 5 W., at Big Falls power plant of Lake Superior District Power Co., 6 miles northeast of Tony and 14 miles northeast of Ladysmith, Rusk County.

DRAINAGE AREA.—1,910 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—October 1, 1923, to September 30, 1924. January 2, 1914, to September 30, 1923, 8 miles below present site, and February 15, 1903, to December 2, 1906, at Ladysmith, 6 miles farther downstream.

DISCHARGE MEASUREMENTS.—Made from boat or by wading.

DETERMINATION OF DISCHARGE.—Discharge of turbines in second-feet corresponding to the number of kilowatts is determined for the day; to this quantity is added discharge through waste gates and over spillway which is computed from theoretical formula.

EXTREMES OF DISCHARGE.—Maximum mean daily discharge, 9,320 second-feet April 18; minimum mean daily discharge, 536 second-feet December 14.

REGULATION.—Diurnal fluctuation is caused by operation of power plant at which station is located. Chippewa & Flambeau Improvement Co. operates storage reservoirs at headwaters having an effective capacity of 1.15 billion cubic feet. Weekly fluctuations are caused by operation of power plants at Park Falls and storage reservoirs above Park Falls.

ACCURACY.—The computation of discharge through turbines is good. Computation of waste is poor. Records fair, becoming poor at high stages.

Cooperation.—Power-house data is furnished by Lake Superior District Power Co.

Daily discharge, in second-feet, of Flambeau River near Ladysmith, Wis., for the year ending September 30, 1924

# JUMP RIVER AT SHELDON, WIS.

Location.—In sec. 26, T. 33 N., R. 5 W., at highway bridge in Sheldon, Rusk County, 11 miles above mouth.

Drainage area.—510 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—July 22, 1915, to September 30, 1924.

GAGE.—Chain gage bolted to downstream handrail of bridge; read by Mrs. Elsa Clark.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of heavy gravel, clean and free from vegetation. Right bank high and not subject to overflow; left bank may be overflowed occasionally.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.55 feet at 8 a.m. April 26 (discharge, 7,300 second-feet); minimum discharge, estimated 14 second-feet January 25-31 (stage-discharge relation affected by ice).

1915-1924: Maximum stage recorded, 11.48 feet March 26, 1920 (discharge, 15,600 second-feet revised). Minimum discharge that of 1924.

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation permanent except as affected by ice. Rating curve well defined above 50 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except as indicated in footnote to table of daily discharge. Open-water records good; winter records fair.

The following discharge measurements were made:

January 13, 1924: Gage height, 3.37 feet; discharge, 22.4 second-feet. February 7, 1924: Gage height, 3.90 feet; discharge, 19.3 second-feet.

June 18, 1924: Gage height, 3.38 feet; discharge, 226 second-feet.

<sup>4</sup> Stage-discharge relation affected by ice.

#### BAU CLAIRE RIVER NEAR AUGUSTA, WIS.

LOCATION.—In sec. 12, T. 26 N., R. 6 E., at Trouble Water Bridge, 7 miles northeast of Augusta, Eau Claire County. South Fork of Eau Claire River enters from left 4 miles above station.

Drainage area.—500 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—July 16, 1914, to September 30, 1924.

GAGE.—Chain gage on downstream side of bridge; read by Albert Wagner.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed at bridge and above is sandy and shifting; a short distance below gage channel narrows and a rock outcrop overlain with large boulders forms control. Banks are high and not subject to overflow.

ICE.—Stage-discharge relation seriously affected by ice.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 9.85 feet 3 p.m. April 26 (discharge, 6,520 second-feet); minimum discharge, estimated 35 second-feet January 22-24 and 28 (stage-discharge relation affected by ice).

1914-1924: Maximum open-water stage recorded, 11.98 feet at 9 a.m. March 27, 1920 (discharge, 8,720 second-feet); minimum discharge, 3.5 second-feet, January 27, 1918 (stage-discharge relation affected by ice).

Accuracy.—Stage-discharge relation changed slightly during summer. Rating curve fairly well defined. Gage read to quarter-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table, except as indicated in footnote to table of daily discharge. Records fair.

## RED CEDAR RIVER NEAR COLFAX, WIS.

- LOCATION.—In sec. 27, T. 30 N., R. 11 W., at highway bridge 4½ miles north of Colfax, Dunn County. Hay River enters from right 11 miles below and Trout Creek, also from right, 3½ miles above station.
- Drainage area.—1,100 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles.
- RECORDS AVAILABLE.—March 19, 1914, to September 30, 1924.
- Gage.—Chain gage attached to downstream side of bridge; read by Andrew Lundequam.
- DISCHARGE MEASUREMENTS.—Made from downstream side of bridge.
- CHANNEL AND CONTROL.—Bed composed of rock and gravel; small amount of grass growth during summer. Left bank high and not subject to overflow; right bank medium high and may be overflowed during extremely high water. Control poorly defined.
- EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.20 feet at 5 p. m. April 5 (discharge, 3,380 second-feet); minimum stage, 0.82 foot at 8.30 a. m. November 1 (discharge, 297 second-feet).
  - 1914–1924: Maximum stage recorded, 6.95 feet at 8 a. m. March 26, 1920 (discharge, 7,610 second-feet); minimum discharge, about 233 second-feet December 18, 1921 (stage-discharge relation probably affected by ice).
- REGULATION.5—The following dams and reservoirs are used to regulate flow in Red Cedar River. Owing to operation of these reservoirs, the flow at the station is not natural.

<sup>&</sup>lt;sup>5</sup> From data on file in engineering department of Railroad Commission of Wisconsin.

Reservoirs used to regulate flow of Red Cedar River

Dam	Location	Approxi- mate capacity (millions of cubic feet)
Long Lake Cedar Lake Birch Lake Bear Lake	Sec. 24, T. 37 N., R. 11 W. Sec. 21, T. 36 N., B. 10 W. Sec. 25, T. 37 N., R. 10 W. Sec. 7, T. 36 N., R. 11 W.	400 400 475 150 1,425

Accuracy.—Stage-discharge relation slightly affected by backwater from dam at Colfax. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Open-water records fair; winter records poor.

Note.—Stage-discharge relation affected by ice Dec. 11-26 and Dec. 29 to Mar. 19; mean discharge estimated from occasional gage heights, two discharge measurements, weather records, and a study of discharge in adjacent drainage basins. Gage not read Nov. 17-19 and Apr. 30 to May 2; discharge interpolated. Gage not read June 24-28; mean discharge estimated from precipitation records and a comparison with flow in adjacent drainage basins.

### BLACK RIVER AT NEILLSVILLE, WIS.

- LOCATION.—In sec. 15, T. 24 N., R. 2 W., at lower highway bridge in Neillsville, Clark County. O'Neill Creek enters from left 1 mile above gage and Cunningham Creek, also from left, 1½ miles below.
- Drainage area.—774 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).
- RECORDS AVAILABLE.—April 6, 1905, to March 31, 1909; December 11, 1913, to September 30, 1924.
- Gage.—Chain gage fastened to downstream side of highway bridge; read by A. Bissell.
- DISCHARGE MEASUREMENTS.—Made from bridge or by wading.
- CHANNEL AND CONTROL.—Bed composed of heavy gravel and rock. Control at head of rapids, a few hundred feet below gage. Banks high and rocky; water will not overflow banks.
- Extremes of discharge.—Maximum stage recorded during year, 12.4 feet at 7 a. m. and 5 p. m. April 26 (discharge, 11,200 second-feet); minimum discharge, estimated 10 second-feet February 26 (stage-discharge relation affected by ice.
  - 1905-1909; 1913-1924: Maximum stage recorded, 19.8 feet June 6, 1905 (discharge, about 29,400 second-feet); minimum open-water stage recorded 1.9 feet August 8, 1920 (discharge, approximately 26 second-feet); an estimated minimum discharge of 5 second-feet during frozen periods in February, 1918.
  - The flood that occurred October 6, 1911, probably exceeded 29,000 second-feet, although data are not available regarding stage at gage section during this flood.
- REGULATION.—Several dams on Black River and tributaries above Neillsville are used to create a head for developing power. Operation of these plants causes a slight diurnal fluctuation at gage, especially during winter when the flow is at a minimum.

Accuracy.—Stage-discharge relation practically permanent, except as affected by ice. Rating curve well defined. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Open-water records good except at extremely low stages, for which they are fair; records for winter poor.

The following discharge measurements were made:

January 8, 1924: Gage height, 2.77 feet; 6 discharge, 16.1 second-feet. February 9, 1924: Gage height, 3.44 feet; 6 discharge, 20.6 second-feet. May 17, 1924: Gage height, 5.49 feet; discharge, 1,290 second-feet.

Daily discharge, in second-feet, of Black River at Neillsville, Wis., for the year ending September 30, 1924

#### LA CROSSE RIVER NEAR WEST SALEM, WIS.

- LOCATION.—In sec. 32, T. 17 N., R. 6 W., at highway bridge 2 miles west of West Salem, La Crosse County, and 10 miles above mouth of river. Dutch Creek enters from right 6 miles above station.
- Drainage area.—412 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles.
- RECORDS AVAILABLE.—December 22, 1913, to September 30, 1924.
- Gage.—Chain gage attached to concrete guardrail on upstream side of bridge; read by J. R. Carlson.
- DISCHARGE MEASUREMENTS.—Made from bridge or by wading.
- CHANNEL AND CONTROL.—Bed composed of heavy gravel and rock; free from vegetation. Right bank high and not subject to overflow; left bank above gage low, and subject to overflow at flood stages. Control for low stages is a rocky riffle with a fall of about 6 inches, which is apparently drowned out at a stage of about 2.2 feet, causing a reversal in the rating curve.
- EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.9 feet at 6 p. m. August 20 (discharge, 2,540 second-feet); minimum discharge, estimated 90 second-feet January 6 (stage-discharge relation affected by ice). 1913–1924: Maximum stage recorded, 8.45 feet March 16, 1919 (discharge about 3,620 second-feet); minimum discharge same as for 1924.
- ICE.—Stage-discharge relation seriously affected by ice.
- REGULATION.—Diurnal fluctuation at gage, amounting at low stages from 0.10 to 0.40 foot, is caused by operation of power plants, especially at Neshonoc Dam a few miles above.
- Accuracy.—Stage-discharge relation changed slightly. Standard rating curve well defined between 180 and 2,300 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except as indicated in footnote to daily-discharge table. Records poor.

### UPPER IOWA RIVER NEAR DECORAH, IOWA

Location.—In sec. 13, T. 98 N., R. 8 W., 500 feet above highway bridge in Freeport, Winneshiek County, 3 miles below Decorah, and 4 miles above upper power plant of Interstate Power Co. Trout Run enters 1 miles above station.

Drainage area.—560 square miles (measured on United States Geological Survey map; scale, 1:500,000).

RECORDS AVAILABLE.—August 27, 1913, to November 21, 1914; May 12, 1919, to September 30, 1924.

Gage.—Gurley graph water-stage recorder on left bank; inspected by Mrs. W. D. Gross.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—A rock ledge probably forms permanent control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.98 feet at 2 a. m. August 19 (discharge, 7,140 second-feet); minimum discharge by extension of rating curve, 40 second-feet on December 31 and several days in January.

1913-1914; 1919-1922: Maximum stage recorded, 10.42 feet at 2 p. m. February 22, 1922 (discharge, 14,700 second-feet); minimum discharge, 21 second-feet February 15, 1923.

Ice.—Stage-discharge relation affected by ice for short periods during extremely cold weather.

REGULATIONS.—Several mills at Decorah may cause slight diurnal fluctuations. Accuracy.—Stage-discharge relation fairly permanent. Rating curve well defined above 80 second-feet. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying to rating table mean daily gage height obtained from recorder graph except as explained in footnote to table of daily discharge. Records good.

The following discharge measurements were made:

May 13, 1924: Gage height, 1.91 feet; discharge, 161 second-feet.

August 21, 1924: Gage height, 4.82 feet; discharge, 1,980 second-feet.

63479-28---6

Daily discharge, in second-feet, of Upper Iowa River near Decorah, Iowa, for the year ending September 30, 1924

### WISCONSIN RIVER AT WHIRLPOOL RAPIDS, NEAR RHINELANDER, WIS.

- LOCATION.—In sec. 4, T. 35 N., R. 8 E., at head of Whirlpool Rapids, 1 mile below outlet of Crescent Lake, 3 miles below power station of Rhinelander Power Co., and 10 miles southwest of Rhinelander, Lincoln County.
- Drainage area.—1,160 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).
- RECORDS AVAILABLE.—September 15, 1915, to September 30, 1924. December 1, 1905, to September 30, 1915, 3 miles upstream.
- Gage.—Stevens continuous water-stage recorder on right bank; inspected by Clarence Jewell.
- DISCHARGE MEASUREMENTS.—Made from cable 150 feet above gage.
- CHANNEL AND CONTROL.—Bed of heavy gravel and rock. Banks medium high and not subject of overflow. Control is head of rapids, 100 feet below gage; well defined and permanent.
- EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.55 feet at 6 p. m. April 18 (discharge, 3,480 second-feet); minimum stage, 1.00 foot at 8 p. m. July 20 (discharge, 279 second-feet).
  - 1905–1924: Maximum stage recorded, 5.61 feet April 22, 1916 (discharge, 5,250 second-feet); minimum discharge, no flow at old location during August and September, 1907, and June and July, 1908. Minimum flow is caused almost entirely by regulation and at present location probably some discharge will always occur. Minimum stage at new location 0.65 foot July 7, 1918 (discharge, 165 second-feet).
- REGULATION.—Flow is regulated by 14 reservoirs <sup>7</sup> and three power plants above station. The aggregate capacity of reservoirs is 2.8 billion cubic feet during summer and 3.6 billion cubic feet during winter.
- Accuracy.—Stage-discharge relation permanent. Rating curve well defined. Water-stage recorder operated satisfactorily except as indicated in footnote to table of daily discharge. Daily discharge ascertained by use of discharge integrator, except as explained in footnote to table of daily discharge. Records fair.

#### WISCONSIN RIVER AT MERRILL, WIS.

LOCATION.—At highway bridge at east end of Merrill, Lincoln County, 1,000 feet below power house of Merrill plant of Wisconsin Valley Electric Co., and half a mile below mouth of Prairie River.

DRAINAGE AREA.—2,630 square miles (measured on Wisconsin Geological and Natural History Survey map, edition of 1911; scale, 1 inch = 6 miles).

RECORDS AVAILABLE.—November 16, 1902, to September 30, 1924.

Gage.—Gurley water-stage recorder installed July 1, 1923; inspected by Otto Lueck.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Bed composed of heavy gravel and rock; nearly permanent. Small island below gage and small rapids on either side probably constitute control. Banks fairly high and seldom overflowed.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 9.65 feet at 7 a. m. April 17 (discharge, 13,300 second-feet); minimum stage, 3.1 feet December 11 and July 28 (discharge, 480 second-feet; caused by regulation.) 1902–1924: Maximum stage recorded, approximately 17.5 feet July 24, 1912 (discharge, 45,000 second-feet). Minimum stage, 2.45 feet September 26, 1908 (discharge, about 90 second-feet).

REGULATION.—Above the gaging station are 17 reservoirs, 8 which are operated by Wisconsin Valley Improvement Co. for the purpose of regulating flow in Wisconsin River. The aggregate capacity of these reservoirs is about 6½ billion cubic feet.

In addition to the above reservoirs, there are eight dams on the Wisconsin and Tomahawk Rivers above station operated for power.

Accuracy.—Stage-discharge relation practically permanent, except as affected by ice. Rating curve well defined above 1,000 second-feet. Water-stage recorder operated satisfactorily except as noted in footnote to daily-discharge table throughout year. Daily discharge determined by means of discharge integrator. Records good.

#### WISCONSIN RIVER AT KNOWLTON, WIS.

LOCATION.—In N. ½ sec. 29, T. 26 N., R. 7 E., 50 feet below left end of a combination railroad-highway bridge of Chicago, Milwaukee & St. Paul Railway on State trunk highway No. 73 at Knowlton, Marathon County, 1½ miles below mouth of Big Eau Pleine River which enters from right.

Drainage area.—4,360 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—July 13, 1921, to September 30, 1924. Gage heights obtained since May 1, 1915, by United States Weather Bureau.

Gage.—Gurley water-stage recorder on left bank; installed August 6, 1921; inspected by W. T. Guenther.

DISCHARGE MEASUREMENTS.—Made from bridge, from boat, or by wading.

CHANNEL AND CONTROL.—Bed composed of sand and light gravel. Control not well defined; there is, however, a decided contraction of channel at an island 2,500 feet below gage. Right bank high and seldom overflowed; left bank of medium height and is overflowed at extreme flood stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 14.8 feet at 8 a. m. April 18 (discharge, about 32,500 second-feet); minimum stage, 1.44 feet at 6 a. m. December 17 (discharge, 890 second-feet).

1921–1924: Maximum stage recorded, 19.5 feet at 10 p. m. April 10, 1922 (discharge, 49,800 second-feet); minimum stage, 1.0 foot at 2 a. m. August 15, 1921 (discharge about 670 second-feet; revised).

REGULATION.—No storage reservoirs discharge into Wisconsin River between Knowlton and Merrill. See "Regulation" in station description of Wisconsin River at Merrill. Between Knowlton and Merrill are four dams operated for power.

Accuracy.—Stage-discharge relation permanent. Rating curve fairly well defined between 1,600 and 30,000 second-feet. Operation of water-stage recorder satisfactory except as indicated in footnote to daily-discharge table. Daily discharge obtained by applying rating table to mean daily gage height. Open-water records fair when automatic gage was operating satisfactorily; records for other periods poor.

The following discharge measurement was made:

May 20, 1924: Gage height, 4.96 feet; discharge, 6,190 second-feet.

Daily discharge, in second-feet, of Wisconsin River at Knowlton, Wis., for the year ending September 30, 1924

### WISCONSIN RIVER NEAR NEKOOSA, WIS.

LOCATION.—In sec. 15, T. 21 N., R. 5 E., 1½ miles below Nekoosa, Wood County. Tenmile Creek enters from left 4 miles below station.

Drainage area.—5,500 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—May 21, 1914, to September 30, 1924.

GAGE.—Gurley water-stage recorder on right bank; installed January 31, 1923; inspected by Henry Mans.

DISCHARGE MEASUREMENTS.—Made from cable just above gage.

CHANNEL AND CONTROL.—Bed composed of gravel; clean, permanent. Banks high and are seldom overflowed.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.00 feet at 9 a. m. April 19 (discharge, 38,200 second-feet); minimum discharge, estimated 400 second-feet at 6 p. m. January 13 (stage-discharge relation affected by ice).

1914-1924. Maximum stage recorded, 16.1 feet at 1 a. m. April 12, 1922 (discharge, 61,000 second-feet); minimum discharge same as for 1924. Minimum flow is due to regulation.

ICE. Stage-discharge relation seriously affected by ice.

REGULATION.—No storage reservoirs discharge into Wisconsin River between Nekoosa and Merrill. See "Regulation" in station description of Wisconsin River at Merrill. Between Nekoosa and Merrill are 12 dams operated for power.

Accuracy.—Stage-discharge relation permanent, except as affected by ice. Rating curve well defined. Operation of water-stage recorder satisfactory except as indicated in footnote to table of daily discharge. Daily discharge ascertained by use of discharge integrator. Open-water records excellent; winter records fair.

#### WISCONSIN RIVER AT MUSCODA, WIS.

- Location.—In sec. 1, T. 8 N., R. 1 W., at highway bridge 1 mile north of Muscoda, Grant County. Eagle Mill Creek enters from right half a mile below and Underwood Creek from left 4½ miles above station.
- Drainage area.—10,300 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).
- RECORDS AVAILABLE.—December 21, 1902, to December 31, 1903; December 1, 1913, to September 30, 1924. Gage heights November 1, 1908, to December 31, 1912, published in United States Weather Bureau bulletin, "Daily river stages," pts. 9-11.
- Gage.—Chain gage fastened to handrail on upstream side of bridge; read by Bud Rice.
- EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 789 feet at 5 p. m. April 24 (discharge, 41,400 second-feet); minimum discharge, 2,500 second-feet on February 4 (stage-discharge relation affected by ice).
  - 1903, 1914-1924: Maximum stage recorded, 10.60 feet at 7 a. m. April 16, 1922 (discharge, 72,100 second-feet); minimum discharge, estimated 1,600 second-feet December 20, 1921 (stage-discharge relation affected by ice).
  - According to records of United States Weather Bureau 9 (see note under "Gage"), on June 11, 1881, the river reached a stage of 11.1 feet and during August, 1868, zero on gage; discharge not computed owing to changes in channel and datum of gage.
- REGULATION.—Nearest power plant above station is at Prairie du Sac, 40 miles distant; considerable diurnal fluctuation has been observed at gage. Owing to regulation by storage in the headwaters, the flow at this station is not natural.
- Accuracy.—Stage-discharge relation not permanent, also affected by ice. Rating curve fairly well defined above 4,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records poor.

Daily river stages, pt. 10, p. 98, U. S. Dept. Agr.

### TOMAHAWK RIVER NEAR BRADLEY, WIS.

Location.—In sec. 16, T. 36 N., R. 6 E., 2 miles west of Cassion, 4 miles north of Bradley, Oneida County, 4 miles below mouth of Bearskin Creek, and 8 miles above mouth.

Drainage area.—422 square miles.

RECORDS AVAILABLE.—September 18, 1914, to September 30, 1924.

Gage.—Slope gage fastened to concrete posts on right bank; installed September 24, 1919; read by H. F. Hemmings.

DISCHARGE MEASUREMENTS.—Made from cable half a mile below gage.

Channel and control.—Bed at gage and a short distance below, sandy and likely to shift. Control is formed by rapids 2,000 feet below gage. Bed at cable section heavy gravel. When a head of 15 feet is maintained in Rice Lake storage dam, in secs. 4 and 9, T. 35 N., R. 6 E., backwater will extend halfway up the rapids and may affect stage-discharge relation slightly. Maximum head maintained during the year was considerably less than 15 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.8 feet April 20 and 21 (discharge, 1,120 second-feet); minimum discharge estimated, 205 second-feet January 17 (stage-discharge relation affected by ice).

1914–1924. Maximum stage recorded, 6.9 feet April 24, 1916 (discharge, 2,200 second-feet); minimum stage, 1.29 feet July 1 and August 9, 1921 (discharge, 132 second-feet).

Ice.—Stage-discharge relation seriously affected by ice.

REGULATION.—The following reservoirs are maintained above station for the purpose of regulating flow of Wisconsin River.

### Reservoirs used to regulate flow of Wisconsin River

Name Loca			Area of	Drain-	Capacity (mil- lions of cubic feet)	
	Location of reservoir	Location of dam	reser- voir	age area	Sum- mer	Winter
Squirrel Monocqua.	T. 39 N., R. 5 E. Tps. 38-40 N., Rs. 6-7 E.	Sec. 30, T. 39 N., R. 5 E Sec. 10, T. 39 N., R. 6 E	Sq. mi. 3.00 11.31	Sq. mi. 17.07 81.60	152 291	152 651
			14. 31	98. 67	443	803

Accuracy.—Stage-discharge relation probably permanent, except as affected by ice. Rating curve poorly defined below 372 second-feet; fairly well defined above. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating curve, except as indicated in footnote to table of daily discharge. Open-water records for medium and high stages fair; low-water and winter records poor.

### PRAIRIE RIVER NEAR MERRILL, WIS.

LOCATION.—On line between secs. 20 and 29, T. 32 N., R. 7 E., at highway bridge 4½ miles northeast of Merrill, Lincoln County, and 5½ miles above mouth of river. Haymeadow Creek enters 5 miles above station.

DRAINAGE AREA.—164 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—January 17, 1914, to September 30, 1924.

Gage.—Chain gage attached to upstream side of bridge; read by Mrs. Meta Krause.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel; clean and free from vegetation. Right bank high, not subject to overflow; left bank may be overflowed at extreme flood stages; banks wooded. Control not well defined.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.30 feet April 17 and 18 (discharge, 1,630 second-feet); minimum discharge, estimated 60 second-feet February 23-25 and March 8-9 (stage-discharge relation affected by ice).

1914-1924: Maximum stage recorded, 6.1 feet April 22, 1916, and April 22, 1923 (discharge, 2,290 second-feet); minimum discharge occurred in 1924.

Ice.—Stage-discharge relation seriously affected by ice.

REGULATION.—None.

Accuracy.—Stage-discharge relation permanent; affected by ice December 14, 15, and January 1 to March 22. Rating curve well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating curve, except for periods in which stage-discharge relation was affected by ice, for which it was obtained by applying to rating table daily gage height corrected for ice effect by means of discharge measurements, observer's notes, and weather records. Records excellent for periods of open water; for winter fair.

#### EAU CLAIRE RIVER AT KELLY, WIS.

LOCATION.—In sec. 13, T. 28 N., R. 8 E., at highway bridge three-fourths mile northeast of Kelly, Marathon County, 1 mile above mouth of Big Sandy Creek, which enters from right, and 4½ miles above mouth of river.

Drainage area.—326 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—January 1, 1914, to September 30, 1924.

GAGE.—Chain gage attached to downstream side of highway bridge; read by August Krueger.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of heavy gravel and rock. Gage is in rapids which form control. Banks medium high and not subject to overflow.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.50 feet at 9 a.m. April 17 (discharge, 3,850 second-feet); minimum discharge, estimated 35 second-feet January 26 and March 13-15 (stage-discharge relation affected by ice).

1914-1924: Maximum stage recorded, 7.40 feet at 3 p. m. April 9, 1922 (discharge, 6,320 second-feet); minimum discharge, estimated 30 second-feet, December 6, 1917 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation practically permanent during year. Rating curve well defined between 70 and 3,200 second-feet. Gage read to hundredths once daily. Daily discharge determined by applying daily gage height to rating table. Open-water records good; winter records fair.

The following discharge measurements were made:

February 20, 1924: Gage height, 2.18 feet; 10 discharge, 61.6 second-feet.

March 13, 1924: Gage height, 2.34 feet; 10 discharge, 39.4 second-feet.

May 21, 1924: Gage height, 1.70 feet; discharge, 363 second-feet.

<sup>10</sup> Stage-discharge relation affected by ice.

### BIG EAU PLEINE RIVER NEAR STRATFORD, WIS.

LOCATION.—In sec. 13, T. 27 N., R. 3 E. at highway bridge at a place locally known as Weber farm, 2 miles north of Stratford, Marathon County, and 1 mile above Chicago & Northwestern Railway Bridge. Dill Creek enters from right 5 miles above station.

63479-28---7

Drainage area.—223 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—July 24, 1914 to September 30, 1924.

GAGE.—Vertical staff on right bank; read by Christian Weber and John Weber. DISCHARGE MEASUREMENTS.—Made by wading or from highway bridge half a mile below gage.

Channel and control.—Bed composed of heavy gravel and rock. Control at head of rapids 100 feet below gage. Banks high and will be overflowed only at stage of about 15 feet and above.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 10.2 feet at 7 a. m. August 22 (discharge, 7,510 second-feet); minimum stage, 1.34 feet December 15 and 16 (discharge, about 3 second-feet).

1914-1924: Maximum stage recorded, 10.9 feet Nov ember 10, 1919 (discharge, 8,630 second-feet); minimum stage, 1.23 feet August 17 and 18, 1923 (discharge, approximately 2.3 second-feet). The flood of June, 1914, reached a stage of 20.7 feet as determined by levels run to high-water marks.

Accuracy.—Stage-discharge relation practically permanent, except as affected by ice. Rating curve well defined between 5 and 4,000 second-feet. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good during medium and high stages; during low stages fair; for extreme low water may be poor.

The following discharge measurements were made:

May 18, 1924: Gage height, 2.60 feet; discharge, 184 second-feet. July 26, 1924: Gage height, 1.53 feet; discharge, 6.6 second-feet.

Daily discharge, in second-feet, of Big Eau Pleine River near Stratford, Wis., for the year ending September 30, 1924

### KICKAPOO RIVER AT GAYS MILLS, WIS.

Location.—In sec. 28, T. 10 N., R. 4 W., at highway bridge immediately below Norwood Mill, in Gays Mills, Crawford County, 25 miles above mouth of river and 2 miles below mouth of Tainter Creek, which enters from right.

Drainage area.—629 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—December 25, 1913, to September 30, 1924.

Gage.—Chain gage fastened to downstream side of bridge; read by George Atwood.

DISCHARGE MEASUREMENTS.-Made from bridge or by wading.

CHANNEL AND CONTROL.—Channel composed of rock covered by a deposit of sand and silt. Banks fairly high and not subject to overflow at ordinary high stages. No definite control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 10.7 feet at 8 a.m. August 4 (discharge about 3,370 second-feet); minimum discharge, 175 second-feet, estimated January 21 (stage-discharge relation affected by ice).

1914-1924: Maximum stage recorded, 15.05 feet March 24, 1917 (discharge, about 6,300 second-feet); minimum discharge about 100 second-feet during latter part of January, 1915 (stage-discharge relation affected by ice).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Mills at Gays Mills immediately above station, Soldiers Grove, 7 miles upstream and at several points above Soldiers Grove use comparatively little storage, so that recorded flow past station represents nearly the natural flow. During low stages a small diurnal fluctuation is observed at gage.

Accuracy.—Stage-discharge relation not permanent, affected by ice during winter. Gage read to half-tenths twice daily. Rating curve fairly well defined below 2,000 second-feet. Daily discharge ascertained by applying mean daily gage height to rating table except as indicated in footnote to table of daily discharge. Records fair.

#### TURKEY RIVER AT GARBER, IOWA

Location.—In sec. 36, T. 92 N., R. 4 W., at single-span highway bridge at Garber, Clayton County, 2,000 feet below mouth of Elk Creek.

Drainage area.—1,530 square miles (measured on map by United States Geological Survey; scale, 1: 500,000).

RECORDS AVAILABLE.—August 29, 1913, to November 30, 1916; May 14, 1919, to September 30, 1924.

Gage.—Chain gage attached to downstream handrail of bridge; read by E. J. Prolow.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed of sand and gravel; shifting. Right bank high and not subject to overflow; left bank is overflowed at stages above 13 feet, the road to left end of bridge being overflowed at gage height 22 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 17.45 feet at 10.30 p. m. August 21 (discharge, by extension of rating curve, 13,800 second-feet); minimum stage, 3.42 feet at 8 a. m. June 5 (discharge, 174 second-feet).

1913-1916; 1919-1924: Maximum stage recorded, 28.06 feet at 4.25 a.m. February 23, 1922 (discharge, about 26,600 second-feet); minimum stage, 3.55 feet September 5-7, 1922 (discharge, 88 second-feet).

Ice.—Stage-discharge relation affected by ice.

REGULATIONS.—An electric light plant and gristmill at Elkader may cause slight diurnal fluctuation.

Accuracy.—Stage-discharge relation for low water changed during high water in July or August. Rating curves fairly well defined between 200 and 11,000 second-feet. No record for January and February. Gage read to hundredths twice daily during remainder of year. Daily discharge ascertained by applying mean daily gage height to rating table. Records fair.

The following discharge measurements were made:

May 12, 1924: Gage height, 3.90 feet; discharge, 327 second-feet.

August 22, 1924: Gage height, 10.34; discharge, 5,650 second-feet.

### AQUOKETAM RIVER BELOW NORTH FORK OF MAQUOKETA RIVER, NEAR MAQUOKETA, IOWA

LOCATION.—In SW. ¼ NE. ¼ sec. 17, T. 84 N., R. 3. E., at Bridgeport Bridge, 3 miles northeast of Maquoketa, Jackson County, 1,200 feet above mouth of Mill Creek and 2 miles below mouth of North Fork of Maquoketa River.

Drainage area.—1,600 square miles (measured on map issued by United States

Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—September 1, 1913, to September 30, 1924.

GAGE.—A continuous water-stage recorder on midstream pier of downstream side of bridge; installed July 14, 1924. Chain gage on downstream handrail of bridge read previous to installation of recorder. Readings and inspection by John Strodthoff.

DISCHARGE MEASUREMENTS.—Made from bridge.

CHANNEL AND CONTROL.—Bed composed of sand and mud. Above 13-foot stage overflow occurs under a pile-trestle approach on left side. Control not definite; shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 19.8 feet at midnight, August 20 (discharge, 19,300 second-feet); minimum discharge probably occurred in January; not recorded.

1913-1924: Maximum stage recorded, 22.0 feet March 27, 1916 (discharge, 21,300 second-feet); minimum stage, 1.59 feet December 25, 1918 (discharge, estimated 245 second-feet).

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation fairly permanent. Rating curve fairly well defined below 8,000 second-feet and poorly defined below 16,000 second-feet. Gage read to hundredths once daily. On and after July 14, water-stage recorder obtained a continuous record of stage. Daily discharge ascertained by applying mean daily gage height to rating table except as noted in footnote to daily-discharge table. Records fair.

#### ROCK RIVER AT AFTON, WIS.

LOCATION.—On line between secs. 22 and 27, T. 2. N., R. 12 E., at highway bridge in Afton, Rock County, 9 miles above Illinois State line. Bass Creek enters from right three-fourths mile below station.

Drainage area.—3,190 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—February 5, 1914, to September 30, 1924.

GAGE.—Chain gage fastened to downstream side of bridge; read by George Robb. DISCHARGE MEASUREMENTS.—Made from downstream side of bridge or by wading.

Channel and control.—Banks medium high and will not be overflowed to any extent at flood stages. Channel gravel and clean silt, practically permanent. Control not well defined.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 7.7 feet August 20 (discharge, 7,100 second-feet); minimum discharge, estimated, 530 second-feet January 13 and 20 (stage-discharge relation affected by ice). 1914-1924: Maximum stage recorded, 10.51 feet March 26, 1918 (discharge, 12,700 second-feet); minimum stage, 0.08 foot December 9, 1922 (discharge, about 370 second-feet).

ICE.—Stage-discharge relation seriously affected by ice.

REGULATION.—Operation of power plants at Janesville and above causes slight fluctuations at gage during low stages.

Accuracy.—Stage-discharge relation practically permanent during year. Rating curve fairly well defined between 600 and 1,060 second-feet; well defined between 1,060 and 6,100 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating curve except as indicated in footnote to table of daily discharge. Openwater records for medium and high stages good; others fair.

### ROCK RIVER AT LYNDON, ILL.

LOCATION.—In sec. 21, T. 20 N., R. 5 E., at highway bridge known as Lyndon Bridge, in Lyndon, Whiteside County, 10 miles above Rock Creek, and 20 miles below dam at Sterling.

DRAINAGE AREA. -9,010 square miles.

RECORDS AVAILABLE.—November 24, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by George Cady.

DISCHARGE MEASUREMENTS.—Made from downstream side of bridge.

Channel and control.—Gravel and boulders; practically permanent. Banks wooded.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 14.7 feet at 7 a.m. August 23 (discharge, 29,800 second-feet); minimum stage, 4.93 feet at 5 p. m. October 17 (discharge, 1,700 second-feet).

1915-1924: Maximum stage recorded, 19.6 feet February 16, 1918 (discharge not determined because of backwater from ice). Maximum open-water stage recorded, 17.0 feet March 28, 1916 (discharge, 39,500 second-feet; minimum stage, 3.72 feet September 27, 1918 (discharge, 536 second-feet).

ICE.—Stage-discharge relation affected by ice.

DIVERSIONS.—Water diverted at Sterling Dam to feed Illinois & Mississippi Canal, probably averages about 100 second-feet.

REGULATION.—Flow past gage is regulated by power plants at Sterling and above, mean of two daily readings of gage during low stages is probably somewhat less than true mean daily gage height due to such regulation. Diurnal fluctuation at gage rather large during low stages.

Accuracy.—Stage-discharge relation practically permanent; seriously affected by ice during winter. Rating curve well defined between 1,000 and 25,000 second-feet, fairly well defined beyond these limits. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except during ice periods. Records good for medium and high stages, fair for ordinary low stages during open-water periods, and poor for extremely low stages and for periods of ice effect.

The following discharge measurements were made: October 18, 1923: Gage height, 5.15 feet; discharge, 1,990 second-feet. July 10, 1924: Gage height, 6.32 feet; discharge, 4,160 second-feet.

Daily discharge, in second-feet, of Rock River at Lyndon, Ill., for the year ending September 30, 1924

<sup>·</sup> Estimated.

#### PECATONICA RIVER AT FREEPORT, ILL.

LOCATION.—In sec. 32, T. 27 N., R. 8 E., at highway bridge at Hancock Avenue, half a mile east of Illinois Central Railroad station at Freeport, Stephenson County, and 2 miles above mouth of Yellow Creek.

Drainage area.—1,330 square miles.

RECORDS AVAILABLE.—September 11, 1914, to September 30, 1924.

GAGE.—Chain gage attached to upstream side of bridge; read by W. C. Krueger.

DISCHARGE MEASUREMENTS.—Made from upstream side of bridge.

Channel and control.—Bed composed of sand and silt; likely to shift. Left bank of only medium height and is overflowed during high water; at stages above about 17.0 feet part of flow passes over left bank and through East Freeport.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 14.85 feet at 5 p. m. August 23 (discharge 4,720 second-feet; minimum stage, 3.24 feet 8 a. m. December 14 (discharge, 246 second-feet.)

1914–1924: Maximum stage recorded, 19.4 feet March 28, 1916 (discharge, 17,000 second-feet; minimum discharge, 200 second-feet December 14, 1917. ICE.—Stage-discharge relation affected by ice.

REGULATION.—A dam and power plant three-fourths mile upstream regulates flow past gage. Only slight diurnal fluctuation is noticeable.

Accuracy.—Stage-discharge relation probably changed during high water in June; affected by ice during winter. Rating curve used October 1 to June 25, well defined between 300 and 7,000 second-feet and fairly well defined above; rating curve used June 26 to September 30, fairly well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table except for period of ice effect. Records good for open-water periods; fair for period of ice effect.

The following discharge measurements were made:

October 17, 1923: Gage height, 4.59 feet; discharge, 456 second-feet.

July 11, 1924: Gage height, 8.20 feet; discharge, 1,550 second-feet.

Daily discharge, in second-feet, of Pecatonica River at Freeport, Ill., for the year ending September 30, 1924

#### SUGAR RIVER NEAR BRODHEAD. WIS.

LOCATION.—In sec. 26, T. 2 N., R. 9 E., at highway bridge 2 miles southwest of Brodhead, Green County, 12 miles above Illinois State line. Jordan Creek enters from right 2 miles below and Little Jordan Creek from right 4 miles above.

Drainage area.—529 square miles (measured on map issued by Wisconsin Geological and Natural History Survey, edition of 1911; scale, 1 inch=6 miles).

RECORDS AVAILABLE.—February 7, 1914, to September 30, 1924.

GAGE.—Chain gage attached to upstream side of bridge; read by Arthur Christensen.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of sand and gravel; not permanent.

Control not well defined. Right bank of medium height; seldom over-flowed; left bank at gage overflowed at stage of about 6.8 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 5.68 feet at 5 p. m. June 26 (discharge, 2,380 second-feet); minimum discharge, estimated, 70 second-feet, January 20 (stage-discharge relation affected by ice). 1914–1924: Maximum stage recorded, 11.4 feet September 13, 1915 (discharge, about 13,000 second-feet); minimum stage, 0.78 foot at 5 p. m.

August 26, 1923 (discharge, about 47 second-feet).

ICE .- Stage-discharge relation affected by ice.

REGULATION.—A power plant at Brodhead 2 miles above station causes slight fluctuation of stage during low water, but pondage is small and it is believed that monthly discharge represents natural flow quite accurately. The difference between morning and evening gage readings is seldom more than 0.2 foot. There are two power plants farther upstream but they probably have no effect on discharge at gage.

Accuracy.—Stage-discharge relation changed during winter. Standard rating curve fairly well defined. Gage read to quarter-tenths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except as indicated in footnote to table of daily discharge. Records fair.

Discharge measurements of Sugar River near Brodhead, Wis., during the year ending September 30, 1924

#### IOWA RIVER AT MARSHALLTOWN, IOWA

LOCATION.—In sec. 23, T. 84 N., R. 18 W., at Third Avenue Bridge, 1 mile north of Marshalltown, Marshall County. Asher Creek enters 1 mile above and Burnett Creek 1 mile below station.

Drainage area.—1,380 square miles (measured on map issued by United States Geological Survey; scale 1:500,000).

RECORDS AVAILABLE.—May 21, 1915, to September 30, 1924. February 23, 1903, to August 8, 1903, 1 mile above present site.

GAGE.—Chain gage attached to downstream handrail of bridge, 60 feet from right pier; read by B. S. Beehrle.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed composed of mud and sand; subject to change.

Banks are subject to overflow. Gravel bar forms control at extreme low water.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 12.95 feet at 7.10 p. m. June 28 (discharge, 7,520 second-feet); minimum discharge, probably occurred during winter.

1915-1924: Maximum stage recorded, 17.74 feet June 4, 1918 (discharge, 42,000 second-feet); minimum discharge, estimated 2 second-feet November 24, 1917.

ICE.—Stage-discharge relation affected by ice.

REGULATIONS.—Operation of a power plant at Eldora causes slight diurnal fluctuation during periods of low-water flow.

ACCURACY.—Stage-discharge relation fairly permanent. Rating curve well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except as explained in footnote to table of daily discharge. Open-water records good; winter records fair.

The following discharge measurements were made: March 5, 1924: Gage height, 8.71 feet; discharge, 2,760 second-feet;

August 26, 1924: Gage height, 7.12 feet; discharge, 2,410 second-feet.

Daily discharge, in second-feet, of Iowa River at Marshalltown, Iowa, for the year ending September 30, 1924

#### IOWA RIVER AT IOWA CETY, IOWA

Location.—In sec. 15, T. 79 N., R. 6 W., 200 feet below highway bridge in Iowa, City, Johnson County, 100 feet below university hydraulic laboratory.

Drainage area.—3,140 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAIDABLE.—November 19, 1921, to September 30, 1924, at present site; from October 30, 1913, to November 18, 1921, at highway bridge 500 feet below Chicago, Rock Island & Pacific Railway; June 1, 1903, to July 21, 1906, at highway bridge, 200 feet above present location.

Gage.—Gurley water-stage recorder installed November 19, 1921; inspected by Floyd A. Nagler.

DISCHARGE MEASUREMENTS.—Made from cable near gage.

CHANNEL AND CONTROL.—Bed composed of sand. Control fairly well defined.

One channel at all stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 15.34 feet at 7 a.m. July 1 (discharge, 19,900 second-feet); minimum discharge, 61 second-feet January 26 (stage-discharge relation affected by ice).

1903-1906; 1913-1924: Maximum stage recorded, 19.45 feet June 7, 1918 (discharge, 36,200 second-feet); minimum discharge about 10 second-feet December 26, 1916.

REGULATION.—Considerable diurnal fluctuation occurs at low stages due to operation of power plant above.

ICE.—Stage-discharge relation affected by ice.

ACCURACY.—Stage-discharge relation fairly permanent. Rating curve well defined. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying to rating table mean daily gage height obtained by inspection of gage-height graph or as explained in footnote to table of daily discharge. Records good.

#### IOWA RIVER AT WAPELLO, IOWA

LOCATION.—In sec. 27, T. 74 N., R. 3 W., at highway bridge half a mile from railroad station at Wapello, Louisa County, and 20 miles from mouth of river. No important tributaries enter near station.

Drainage area.—12,480 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—February 26, 1915, to September 30, 1924.

Gage.—Chain gage attached to bridge near center of first span from right abutment; read by C. W. Warren.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Bed composed of sand and gravel; subject to shift. Right bank high and will not be overflowed; levee along left bank, which broke during flood of June, 1918.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 11.23 feet at 6 p. m. June 28 (discharge, 40,300 second-feet); minimum discharge, estimated 1,000 second-feet January 1-4 (stage-discharge relation affected by ice).

1915-1924: Maximum stage recorded, 14.94 feet at 6 p. m. June 8, 1918 (discharge, 63,100 second-feet). The flood of June, 1892, was probably much higher than flood of 1918.

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation subject to shifts during July; affected by ice December 14, December 31 to March 8. Rating curve fairly well defined. Gage read to hundredths once or more daily. Daily discharge ascertained by applying mean daily gage height to rating table, except during July, when shifting-channel methods were used, and during winter when discharge was estimated from gage heights, observer's notes, and climatological records. Records fair.

COOPERATION.—A large part of the base data and record of daily discharge furnished by Mississippi River Power Co., Keokuk, Iowa.

Discharge measurements of Iowa River at Wapello, Iowa, during the year ending September 30, 1924

## CEDAR RIVER AT JANESVILLE, IOWA

LOCATION.—In sec. 35, T. 91 N., R. 14 W., at highway bridge in Janesville, Bremer County, 3 miles above junction with Shellrock River.

Drainage area.—1,660 square miles (measured on map issued by United States Geological Survey; scale 1: 500,000).

RECORDS AVAILABLE.—April 27, 1905, to September 30, 1906; May 26, 1915, to September 30, 1924.

GAGE.—Chain gage attached to downstream handrail of middle span of highway bridge; read by Mrs. Emma Cameron.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of sand and gravel. The remains of an old milldam forms control; practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.0 feet at 5 p. m. August 22 (discharge, 5,230 second-feet); minimum open-water stage, 1.50 feet at 6.30 p. m. June 10 (discharge, 100 second-feet).

1905-1906; 1915-1924: Maximum discharge, estimated 27,000 second-feet May 29, 1921; minimum discharge, 28 second-feet, October 21, 1922.

Ice.—Stage-discharge relation seriously affected by ice. Observations discontinued during winter.

REGULATION.—There is slight diurnal fluctuation during low-water periods due to operation of power plant at Waverly, 9 miles above station.

Accuracy.—Stage-discharge relation practically permanent. Rating curve well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

The following discharge measurement was made:

May 20, 1924: Gage height, 1.92 feet; discharge, 314 second-feet.

Daily discharge, in second-feet, of Cedar River at Janesville, Iowa, for the year ending September 30, 1924

## CEDAR RIVER AT CEDAR RAPIDS, IOWA

LOCATION.—In sec. 28, T. 83 N., R. 7 W., in central part of Cedar Rapids, Linn County, half a mile below dam and 1,000 feet above Eighth Avenue Bridge-Drainage area.—6,640 square miles (measured on map issued by United States Geological Survey; scale 1: 500,000).

RECORDS AVAILABLE.—February 14, 1903, to September 30, 1924.

Gage.—Gurley water-stage recorder on right bank; installed August 20, 1920; inspected by R. S. Toogood.

DISCHARGE MEASUREMENTS.—Made from Eighth Avenue Bridge.

CHANNEL AND CONTROL.—Bed composed of rock and gravel, free from vegetation and practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 10.54 feet at 4 p. m. August 22 (discharge, 26,300 second-feet); minimum discharge probably occurred during January.

1903-1924.—Maximum stage recorded, 17.2 feet April 1, 1912, and March 26, 1917 (discharge, 54,100 second-feet); minimum stage, 2.23 feet September 9, 1921 (discharge, 190 second-feet).

Greatest known flood probably occurred in June, 1851, when maximum stage was about 20 feet (discharge, estimated 65,000 second-feet).

Ice.—Stage-discharge relation affected by ice during extreme cold weather.

The swift current and proximity to power plant keep river open at other times.

REGULATIONS.—Power plant half a mile above gage causes marked diurnal fluctuations during all periods of low water.

Accuracy.—Stage-discharge relation practically permanent. Rating curve well defined. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying to rating table mean daily gage height as obtained by inspection of recorder graph, except as explained in footnote to table of daily discharge. Records good, except for periods when stage-discharge relation was affected by ice for which they are fair.

The following discharge measurements were made:

May 21, 1924: Gage height, 3.59 feet; discharge. 2,130 second-feet.

August 19, 1924: Gage height, 8.90 feet; discharge, 19,100 second-feet.

Daily discharge, in second-feet, of Cedar River at Cedar Rapids, Iowa, for the year ending September 30, 1924

Day	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June	July	Ang.	Sept.

## SHELLROCK RIVER NEAR CLARKSVILLE, IOWA

LOCATION.—In T. 92 W., R. 16 W., at highway bridge, 1¼ miles northwest of Clarksville, Butler County, and 25 miles above junction of Cedar River.

Drainage area.—1,660 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—May 28, 1915, to September 30, 1924.

Gage.—Chain gage attached to handrail on upstream side of bridge, 75 feet from right abutment; read by Mrs. H. H. Sherburne.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of rock and sand; fairly permanent. Right bank high; left bank will probably be overflowed at extremely high stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.4 feet at 7.30 a. m. October 2 (discharge, 4,200 second-feet); minimum stage occurred during winter.

1915-1924: Maximum discharge recorded, 12,200 second-feet June 2,1916; minimum stage, 0.48 foot August 29 and September 17, 1923 (discharge, 50 second-feet).

In April, 1907, a stage of about 16.5 feet was reached (discharge, estimated 19,000 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Slight diurnal fluctuation of stage may occur during low water, due to operation of power plant at Greene, 10 miles upstream.

Accuracy.—Stage-discharge relation probably permanent. Rating curve well defined. Gage read to hundredths once daily. Discharge ascertained by applying daily gage height to rating table. Records fair.

The following discharge measurement was made: May 20, 1924: Gage height, 1.43 feet; discharge, 288 second-feet.

#### SKUNK RIVER NEAR AMES, IOWA

Location.—In sec. 23, T. 84 N., R. 24 W., at site of old county bridge, 2½ miles north of Ames, Story County, 5 miles above mouth of Squaw Creek, and 3½ miles below Keigley Branch.

Drainage area.—320 square miles (measured on topographic map and on United States post route map).

RECORDS AVAILABLE.—July 28, 1920, to September 30, 1924.

GAGE.—Stevens continuous water-stage recorder installed August 25, 1921; inspected by R. J. Coon.

DISCHARGE MEASUREMENTS.-Made from cable or by wading.

CHANNEL AND CONTROL.—Banks are high, but overflow will occur around right bank during extremely high water. Rock ledge forms permanent control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.21 feet at 9 a. m. June 28 (discharge, 3,010 second-feet). Minimum discharge occurred during January.

1920–1924: Maximum stage recorded, 9.0 feet at 6.30 p. m. February 23, 1922 (discharge, 3, 370 second-feet); mirimum stage, 1.60 feet July 31, 1921 (discharge, 1.5 second-feet).

ICE.—Stage-discharge relation affected by ice for short periods during extremely cold weather.

Accuracy.—Stage-discharge relation probably permanent. Rating curve well defined. Operation of water-stage recorder satisfactory. Daily discharge ascertained by applying mean daily gage height to rating table, except as explained in footnote to table of daily discharge. Records good.

<sup>·</sup> Estimate.

#### SKUNK RIVER AT COPPOCK, IOWA

LOCATION.—In sec. 1, T. 73 N., R. 8 W., at highway bridge one-eighth mile above Chicago, Burlington & Quincy Railroad bridge at Coppock, Henry County, and one-fourth mile above junction with Crooked Creek.

Drainage area.—2,890 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—October 21, 1913, to September 30, 1924.

GAGE.—Chain gage attached to downstream side of bridge; read by J. W. Ricks. DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of gravel and sand; shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.85 feet at 6 a.m. June 29 (discharge, estimated 18,000 second-feet); minimum discharge, estimated at 200 second-feet January 1-9 (stage-discharge relation affected by ice).

1913-1924: Maximum stage recorded, 19.7 feet June 9, 1918 (discharge, estimated 19,600 second-feet); minimum stage, 2.10 feet August 15, 18, 25-27, 1914 (discharge, 33 second-feet).

A stage of about 22 feet occurred on or about May 31, 1903 (discharge, estimated 25,000 second-feet).

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation not permanent. Rating curve fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table, except October 1-25 and July 26 to September 19, when shifting-channel corrections were applied and during winter period when discharge was estimated from gage heights, observer's notes, climatological records, and by comparison with records at Augusta. Records fair.

COOPERATION.—Most of the base data and the record of daily discharge furnished by Mississippi River Power Co., Keokuk, Iowa.

Discharge measurements of Skunk River at Coppock, Iowa, during the year ending September 30, 1924

#### SKUNK RIVER AT AUGUSTA, IOWA

LOCATION.—In sec. 26, T. 69 N., R. 4 W., at highway bridge one-third mile from Augusta post office, Des Moines County, and 12.2 miles above mouth. Drainage area.—4,290 square miles (measured on map issued by United States

Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—October 1 to November 15, 1913; May 27, 1915, to September 30, 1924.

GAGE.—Chain gage attached to downstream handrail of bridge 95 feet from left abutment; read by J. A. Schroder.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed of stream sandy; subject to change. Right bank high and will not be overflowed; left bank overflowed only at extremely high stages. Remains of old milldam 600 feet below gage forms control. Riffie at dam causes a drop of about 3 feet at medium low stages. Backwater from Mississippi probably will not occur more than once in 50 years.

REGULATION.—Natural discharge at extreme low stages occasionally affected by

operation of power plant at Oakland Mills, 26 miles upstream.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.25 feet at 9 a.m. June 29 (discharge, 26,000 second-feet); minimum discharge, estimated 250 second-feet, January 1-9 (stage-discharge relation affected by ice).

1913; 1915-1924: Maximum discharge recorded, 30,800 second-feet, March 28, 1916; minimum discharge, 26 second-feet (by current-meter measurement) September 8, 1919.

A stage of about 21 feet (discharge, 45,000 second-feet) was reached on or about June 1, 1903.

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation not permanent. Rating curve well defined for all but high stages. Gage read to half-tenths once daily. Daily discharge determined by applying daily gage height to rating table, except for stages above 10.0 feet when shifting-channel methods were used, and during winter when it was obtained from daily gage heights, observer's notes, and climatological records. Records fair.

COOPERATION.—A large part of the base data and records of daily discharge furnished by Mississippi River Power Co., Keokuk, Iowa.

#### SQUAW CREEK AT AMES, IOWA

Location.—In sec. 3, T. 83 N., R. 24 W., at footbridge, 1,700 feet above Chicago-& Northwestern Railway bridge, in Ames, Story County, 2 miles abovejunction with Skunk River.

DRAINAGE AREA.—210 square miles (measured from topographic map and on: United States post route map).

RECORDS AVAILABLE.—May 24, 1919, to September 30, 1924.

GAGE.—Vertical staff gage attached to middle pile of left bent of bridge; read by Stanley Collins.

DISCHARGE MEASUREMENTS.—Made from footbridge, by wading, or from Chicago-& Northwestern Railway bridge.

Channel and control.—Bed composed of sand and gravel; shifting. Left bank high; right bank subject to overflow at a stage above 11 feet.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 8.5 feet at 9 p. m. June 28 (discharge, about 2,950 second-feet). Minimum discharge occurred during winter.

Maximum stage in recent years, approximately 14.5 feet June 4, 1918 (discharge, estimated 6,900 second-feet). Occasionally the creek is dry for a short period during summer.

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation not permanent. Rating curve poorly defined. Gage read to hundredths twice daily and more often during periods of high water. Daily discharge ascertained by applying mean daily gage height to rating table, except as explained in footnote to table of daily discharge. Records poor.

## DES MOINES RIVER AT KALO, IOWA

LOCATION.—In sec. 17, T. 88 N., R. 28 W., at Kalo, Webster County, 1½ miles east of Otho, on Minneapolis & St. Louis Railroad, and 1½ miles above mouth of Holiday Creek, which enters from left.

Drainage area.—4,170 square miles (measured on map issued by United States-Geological Survey; scale, 1:500,000.

RECORDS AVAILABLE.—October 18, 1913, to September 30, 1924.

GAGE.—Water-stage recorder on right bank, 300 feet below highway bridge; read by S. C. Fuller.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Channel of gravel; fairly permanent. No well-defined control. Point of zero flow estimated to be at gage height -0.40 foot.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.52 feet at 4 p. m. April 5 (discharge, 3,320 second-feet). Minimum discharge probably occurred during January.

1913-1924: Maximum stage recorded, 14.0 feet May 30, 1915 (discharge, 18,500 second-feet). Minimum discharge, 14 second-feet, October 15, 1922. ICE.—Stage-discharge relation affected by ice.

REGULATION.—Operation of city power plant at Fort Dodge, 7 miles upstream causes diurnal fluctuation during periods of low water.

Accuracy.—Stage-discharge relation probably changed during high water in June. Rating curves fairly well defined. Operation of water-stage recorder satisfactory except as explained in footnote to table of daily discharge. Mean daily gage height ascertained by inspection of gage-height graph. Daily discharge obtained by applying to rating table mean daily gage height. Records fair.

The following discharge measurement was made:

April 2, 1924: Gage height, 3.33 feet; discharge, 2,170 second-feet.

Daily discharge, in second-feet, of Des Moines River at Kalo, Iowa, for the year ending September 30, 1924

## DES MOINES RIVER NEAR BOONE, IOWA

LOCATION.—In sec. 12, T. 84 N., R. 27 W., at highway bridge in Centerville, 2½ miles northwest of Boone, Boone County, 1 mile above Boone waterworks, and 3 miles above Bluff Creek.

Drainage area.—5,480 square miles (measured on map issued by United States Geological Survey, scale, 1: 500,000).

RECORDS AVAILABLE.—April 1, 1920, to September 30, 1924. At site of old gage 3½ miles downstream at Chicago & Northwestern Railway crossing, scattered records of stage have been maintained by United States Weather Bureau from 1905 to 1917.

Gage.—Chain gage attached to downstream side of bridge 20 feet from left end of right span; read by S. A. Elliott.

DISCHARGE MEASUREMENTS.—Made from highway bridge or by wading.

Channel and control.—Well-defined control is formed by the remains of an old dam, 300 feet below bridge. Channel consists of gravel and sand; fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded, 7.0 feet at 8 a. m. March 30 (discharge, 7,350 second-feet). Minimum discharge occurred during January. 1920–1924: Maximum stage recorded, 13.39 feet at 6.30 a. m. July 11, 1920 (discharge, 16,900 second-feet); minimum stage, 1.18 feet at 7 a. m. July 28, 1923 (discharge, 68 second-feet). Highest stage since 1907, 20.54 feet probably on June 6, 1918 (discharge, approximate, 32,000 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—The city power plant at Fort Dodge causes some diurnal fluctuation during periods of extreme low water.

Accuracy.—Stage-discharge relation probably permanent. Rating curve well defined between 800 and 18,000 second-feet. Gage read to hundredths once daily, and more frequently during days of rapidly changing stage. Daily discharge ascertained by applying daily gage height to rating table except as explained in footnote to table of daily discharge. Records good.

63479-28---9

The following discharge measurements were made:
April 3, 1924: Gage height, 5.01 feet; discharge, 4,050 second-feet.

August 29, 1924: Gage height, 3.62 feet; discharge, 2,180 second-feet.

Daily discharge, in second-feet, of Des Moines River near Boone, Iowa, for the year ending September 30, 1924

## DES MOINES RIVER AT DES MOINES, IOWA

- Location.—In sec. 2, T. 78 N., R. 24 W., at Walnut Street Bridge in Des Moines, Polk County, one-fourth mile below dam of Des Moines Electric Co. and one-third mile above mouth of Raccoon River.
- Drainage area.—6,180 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).
- RECORDS AVAILABLE.—October 1, 1902, to August 3, 1903; October 1, 1914, to September 30, 1924, at Walnut Street Bridge. May 27, 1905, to July 20, 1906, at Interurban Bridge near Highland Park 5 miles upstream. United States Weather Bureau have maintained a station at or near present site since July 1, 1897.
- Gage.—Friez water-stage recorder at second pier from east abutment of Walnut-Street Bridge; installed January, 1912.
- DISCHARGE MEASUREMENTS.—Made from one of several bridges near gage.
- Channel and control.—A low timber dam constructed September, 1913, one-fourth mile below gage, was partly destroyed in 1915, but still forms control at medium stages. Back fill around piers of Court Street Bridge, one block downstream, forms control at extremely low stages. Both may be drowned out depending on stage in Raccoon River. A new mouth to this river, dredged farther downstream in 1914, has somewhat relieved backwater conditions at gage.
- Extremes of discharge.—Maximum discharge recorded during year, 7,570 second-feet, March 31 (stage-discharge relation affected by backwater). Minimum stage, 0.50 foot at 10 p. m. December 31 (discharge, about 25 second-feet).
  - 1915-1924: Maximum discharge, about 41,500 second-feet, June 7, 1918; brief periods of zero flow have occurred since construction of dam above gage.
- Ice.—Stage-discharge relation not affected by ice since construction of dam above gage. Numerous bridges below gage occasionally cause ice jams for short periods.
- REGULATION.—Considerable diurnal fluctuation during low water is caused by operation of power plant above. Dam is practically drowned out at stage of 22 feet.
- Accuracy.—Stage-discharge relation probably permanent during year. Rating curve well defined above 150 second-feet. Operation of water-stage recorder satisfactory except as explained in footnote to table of daily discharge. Mean daily gage height obtained by inspection of recorder graph. Daily discharge ascertained by applying to rating table mean daily gage height. Records fair.
- Cooperation.—Gage-height records furnished by United States Weather Bureau.

## DES MOINES RIVER NEAR TRACY, IOWA

Location.—In sec. 19, T. 75 N., R. 17 W., at highway bridge in Bellefontaine, I lahaska County, near Tracy, Marion County, 3 miles above mouth of Cedar Creek and 6 miles below mouth of English Creek.

Drainage area.—12,400 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—March 1, 1920, to September 30, 1924. From about April 22 to December 31, 1910, the United States Engineer Corps maintained daily readings at same site.

Gage.—Chain gage attached to downstream side of bridge near right end of second span from right end of bridge; read by D. M. Coleman. Sea-level elevation of the zero of gage is 671.78 feet.

Drainage measurements.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Solid rock bottom overlain in places with sand and gravel. Right bank high; left bank subject to overflow at high stages. Low-water control well defined.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 16.5 feet, 7 p. m. June 27 (discharge, 38,200 second-feet). Minimum discharge probably occurred during January.

Maximum stage since 1851 approximately 25 feet, May 31, 1903 (discharge, estimated 100,000 second-feet).

Ice.—Stage-discharge relation affected by ice during periods of extreme cold weather.

Accuracy.—Stage-discharge relation fairly permanent. Rating curve well defined between 800 and 40,000 second-feet. Gage read twice daily to hundredths. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

The following discharge measurements were made:

April 23, 1924: Gage height, 5.22 feet; discharge, 3,720 second-feet.

June 27, 1924: Gage height, 16.28 feet; discharge, 37,500 second-feet.

Daily discharge, in second-feet, of Des Moines River near Tracy, Iowa., for the year ending September 30, 1924

## DES MOINES RIVER AT OTTUMWA, IOWA

LOCATION.—At Market Street Bridge, Ottumwa, Wapello County. No large tributary enters within several miles.

DRAINAGE AREA.—13,200 square miles (measured on map issued by United States Geological Survey; scale, 1: 500,000).

RECORDS AVAILABLE.—March 28, 1917, to September 30, 1924. Fragmentary high-water observations 1902-1916.

GAGE.—Chain gage attached to downstream handrail of bridge; read by Henry Eilers.

DISCHARGE MEASUREMENTS.—Made from Vine Street Bridge, 1,500 feet below gage.

CHANNEL AND CONTROL.—Channel fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 12.8 feet at 7 a. m. June 28 (discharge, 37,600 second-feet). Minimum discharge probably occurred in January.

1917-1924: Maximum stage recorded, 16.5 feet June 11, 1917 (discharge, 58,700 second-feet); minimum discharge estimated at less than 350 second-feet during several days in December, 1917 (stage-discharge relation affected by ice).

Maximum discharge since 1850, probably in the last century, occurred May 31, 1903 (discharge, estimated 100,000 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Power plant located a short distance above gage probably produces some diurnal fluctuation at low stages.

Accuracy.—Stage-discharge relation probably permanent during year; affected by ice January 6 to Feburary 2. Rating curve well defined. Gage read to tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good.

COOPERATION.—Gage-height record furnished by United States Weather Bureau-

The following discharge measurements were made:

May 6, 1924: Gage height, 3.06 feet; discharge, 3,550 second-feet.

June 26, 1924: Gage height, 10.77 feet; discharge, 28,800 second-feet.

Daily discharge, in second-feet, of Des Moines River at Ottumwa, Iowa, for the year ending September 30, 1924

## DES MOINES RIVER AT KEOSAUQUA, IOWA

LOCATION.—In sec. 36, T. 69 N., R. 10 W., at county bridge in Keosauqua, Van Buren County, one-fourth mile above old dam site and Government locks. No important tributary enters for several miles.

Drainage area.—13,900 square miles (measured on map issued by United States Geological Survey; scale, 1: 500,000).

RECORDS AVAILABLE.—May 29, 1903, to July 21, 1906; April 5 to December 31, 1910 (United States Engineer Corps); August 3, 1911, to September 30, 1924.

GAGE.—Chain gage attached to upstream handrail of bridge; read by Frank Schreckengast.

DISCHARGE MEASUREMENTS.—Made from bridge to which gage is attached.

CHANNEL AND CONTROL.—Channel shifts considerably at flood stages. Control is a gravel riffle one-fourth mile below gage.

EXTREMES OF DISCHARGE.—Maximum discharge recorded during year, 41,800 second-feet June 28 (by current-meter measurement); minimum discharge, estimated, 400 second-feet January 3 (stage-discharge relation affected by ice).

1903-1906; 1910-1924: Maximum stage recorded, 27.85 feet, June 1, 1903 (discharge, about 97,000 second-feet); minimum stage, 0.0 foot August 28 to September 6, 1911 (discharge, 160 second-feet).

Flood of June 1, 1851, reached a stage of about 24 feet (discharge, estimated 80,000 second-feet).

Ice.—Stage-discharge relation seriously affected by ice.

Accuracy.—Stage-discharge relation for low water probably changed during flood latter part of June. Rating curves fairly well defined. Gage read to half-tenths once daily except Sundays and during winter. Daily discharge obtained by applying daily gage height to rating table except during periods December 14-17, January 1 to February 15, March 2 and 3, when stage-discharge relation was affected by ice. Discharge for these periods estimated by comparison with flow at Ottumwa, observer's notes, one discharge measurement, and climatological records. Records fair.

COOPERATION.—A large part of base data and records of daily discharge furnished by Mississippi River Power Co., Keokuk, Iowa.

Discharge measurements of Des Moines River at Keosauqua, Iowa, during the year ending September 30, 1924

#### RACCOON RIVER AT VAN METER, IOWA

LOCATION.—In SW. ¼ sec. 22, T. 78 N., R. 27 W., at highway bridge one-third mile from railroad station, Van Meter, Dallas County, 1 mile below junction of North and South Raccoon Rivers, and 30 miles above junction of Raccoon and Des Moines Rivers.

DRAINAGE AREA.—3,410 square miles (measured on map issued by United States Geological Survey; scale, 1:500,000).

RECORDS AVAILABLE.—April 25, 1915, to September 30, 1924.

Gage.—Gurley 7-day water-stage recorder; installed May 31, 1923; read by Cal Smith.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed composed of sand and gravel; subject to change. River divided into two channels at low and medium stages by an island. Right bank high; left bank subject to overflow at a stage of 13 feet. At extremely high stage this overflow will extend for several hundred feet beyond left end of bridge.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 15.23 feet at 1 a. m. June 25 (discharge, 20,100 second-feet); minimum discharge probably occurred during winter.

1915–1924: Maximum stage recorded, 17.5 feet June 7, 1917 (discharge, 31,800 second-feet); minimum stage, 1.56 feet, October 22, 1918 (discharge, estimated 28 second-feet).

ICE.—Stage-discharge relation affected by ice.

ACCURACY.—Stage-discharge relation not permanent. Standard rating curve well defined below 15,000 second-feet. Operation of water-stage recorder satisfactory. Mean daily gage height obtained by inspection of recorder graph. Daily discharge ascertained by applying mean daily gage height to rating table except as explained in footnote to table of daily discharge. Records good.

## SUGAR CREEK NEAR KEOKUK, IOWA

LOCATION.—In sec. 7, T. 65 N., R. 5 W., at single-span highway bridge 6 miles northwest of Keokuk, Lee County, on road to Argyle, and 3½ miles above mouth.

DRAINAGE AREA.—113 square miles (measured on county topographic map; scale, 1 inch=2 miles).

RECORDS AVAILABLE.—March 29, 1922, to September 30, 1924.

GAGE.—Gurley 7-day water-stage recorder attached to right abutment of bridge; installed June 25, 1923; read by Mrs. J. B. Williams.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed composed of sand; shifting. Left bank is over-flowed at high stages. A heavy timber and riprap construction 100 feet below gage acts as low-water control; permanent. Elevation of lowest part of control 1.01 feet referred to gage datum. There is slight leakage through control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 9.81 feet at 11 a. m. August 7 (discharge, 2,400 second-feet). Creek dry during parts of October, November, and December.

Maximum known stage, about 20.6 feet June 9, 1905 (discharge, about 15,000 second-feet). This flood was caused by the same historic storm which passed over the adjoining drainage area of Devil's Creek and caused the destructive flood in that stream.

Accuracy.—Stage-discharge relation permanent. Affected by ice during winter. Rating curve well defined below 300 second-feet and fairly well defined above. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

#### FOX RIVER NEAR WAYLAND, MO.

LOCATION.—In NE. 1/4 sec. 25, T. 65 N., R. 7 W., at highway bridge 1 mile above Chicago, Burlington & Quincy Railroad bridge, 2½ miles northwest of Wayland, Clark County, and 3 miles below Brush Creek.

Drainage area.—392 square miles (measured on map of Iowa, scale, 1:500,000, and on topographic maps.)

RECORDS AVAILABLE.—February 22, 1922, to September 30, 1924.

GAGE.—Chain gage bolted to handrail on upstream side of bridge; read by Loren Smith.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of clean sand; shifting. No well-defined control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.32 feet August 6, 7, and 9 (discharge, 3,250 second-feet); minimum stage, 1.98 feet at 7 a. m. November 7 (discharge, 0.6 second-foot).

1922-1924: Maximum and minimum stages and discharges same as given above.

ICE.—Stage-discharge relation affected by ice.

REGULATION.—None.

Accuracy.—Stage-discharge relation not permanent; seriously affected by ice during winter. Rating curve well defined between 80 and 2,000 second-feet. Gage read to hundredths twice daily. Daily discharge ascertained by indirect method for shifting control except as noted in footnote to table of daily discharge. Open-water records good for medium and high stages and fair for low stages. Records poor for periods of ice effect.

## WYACONDA RIVER NEAR CANTON, MO.

LOCATION.—In SE. ½ SW. ½ sec. 33, T. 62 N., R. 6 W., at highway bridge on south road from Canton to Monticello, three-fourths mile below Sugar Creek, 2 miles below north road highway bridge, 3 miles southwest of Canton, Lewis County, and 15 miles above mouth.

DRAINAGE AREA:—447 square miles (measured on map of Iowa, scale, 1:500,000 and on topographic maps).

RECORDS AVAILABLE.—February 20, 1922, to September 30, 1924.

GAGE.—Chain gage bolted to wooden beam between vertical members on upstream side of bridge; read by Fred Schroeder.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed composed of sand and mud; free from vegetation; shifting. No well-defined control. Banks wooded near edge and cultivated beyond; left bank subject to overflow at extreme high stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 12.26 feet at 6 a. m. June 27 (discharge, 3,520 second-feet); minimum discharge, 0.5 second-foot January 8-9 and 19-23 (stage-discharge relation affected by ice).

1922-1924: Maximum and minimum stages and discharges same as given above.

Accuracy.—Stage-discharge relation for low water changed during high water in March; seriously affected by ice during winter. Rating curve used until March 31 fairly well defined above 20 second-feet; curve used after that date fairly well defined. Gage read to hundredths once or twice daily Daily discharge ascertained by applying mean daily gage height to rating table except as described in footnote to table of daily discharge. Records good for medium and high stages; poor for very low stages and for periods of ice effect.

## NORTH FABIUS RIVER AT MONTICELLO, MO.

LOCATION.—In SE. 1/4 sec. 6, T. 61 N., R. 7 W., at highway bridge 1 mile south of Monticello, Lewis County, and 22 miles above confluence with Middle Fabius River.

Drainage area.—452 square miles (measured on State base maps, scale, 1:500,000, and on topographic maps).

RECORDS AVAILABLE.—February 18, 1922, to September 30, 1924.

Gage.—Chain gage fastened to upstream side of bridge; read by Floyd Nelson. DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Bed composed of rock, sand, and silt; shifts occasionally. Control is a coarse gravel bar 1½ miles below gage; clean and fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage during year, determined from floodmarks, 22.9 feet June 26 (discharge by extension of rating curve, 6,370 second-feet; minimum stage, 0.68 foot at 3.45 p. m. November 17 (discharge, 4 second-feet).

1922-1924: Maximum stage recorded that as given above; minimum stage, 0.52 foot July 9, 1922 (discharge, 1 second-foot).

Accuracy.—Stage-discharge relation for low water probably changed during high water in March; affected by ice during winter. Rating curves fairly well defined below 4,000 second-feet. Gage read to hundredths once or twice daily; readings unreliable before May 20. Daily discharge ascertained by applying mean daily gage height to rating table except as noted in footnote to table of daily discharge. Records poor until May 20 and fair afterwards.

Note.—Daily discharge Dec. 7-11 estimated from one discharge measurement. Stage-discharge relation affected by ice Jan. 4-24 and Feb. 6-25; daily discharge ascertained by applying to rating table daily gage height corrected for ice effect by means of one discharge measurement, observer's notes, and weather records.

Stage-discharge relation affected by ice.
 Made during rapidly falling stage; computed discharge, 3,410 second-feet.
 Made during rapidly falling stage; computed discharge, 3,730 second-feet.

#### SALT RIVER NEAR NEW LONDON, MO.

LOCATION.—In NE. ¼ NW. ¼ sec. 36, T. 56 N., R. 5 W., at bridge on State highway No. 8, 1¼ miles below Turkey Creek and 2 miles north of New London, Ralls County.

Drainage area.—2,480 square miles (measured on topographic and United States soil survey maps).

RECORDS AVAILABLE.—February 16, 1922, to September 30, 1924.

Gage.—Chain gage bolted to handrail on upstream side of bridge; read by Wilson Mosley.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed composed of sand and silt; clean and fairly permanent. Control is a gravel bar 200 feet below gage; practically permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 14.21 feet at 6 p. m. June 13 (discharge, 13,700 second-feet); minimum discharge, 28 second-feet September 26-27.

1922-1924: Maximum stage recorded, 24.15 feet at 5 p. m. March 16, 1922 (discharge, 39,800 second-feet); minimum discharge estimated at 12 second-feet August 20, 1922.

ICE.—Stage-discharge relation affected by ice.

REGULATION.—None.

Accuracy.—Stage-discharge relation practically permanent; affected by ice for short periods. Rating curves fairly well defined above 30 second-feet. Gage read to hundredths twice daily; readings rather unreliable for 1922 and part of 1923. Daily discharge ascertained by applying mean daily gage height to rating table except as described in footnote to table of daily discharge. Records of discharge above 30 second-feet are fair for 1922 and 1923 and good for 1924; those below 30 second-feet are poor for 1922 and 1923 and fair for 1924.

#### CUIVRE RIVER NEAR TROY, MO.

LOCATION.—In SW. ¼ sec. 18, T. 49 N., R. 1 E., at Frenchman Bluff highway bridge, 1½ miles above Sugar Creek, 3 miles northeast of Troy, Lincoln County, and 38 miles above mouth.

Drainage area.—908 square miles (measured on topographic maps).

RECORDS AVAILABLE.—February 15, 1922, to September 30, 1924.

GAGE.—Chain gage bolted to handrail on upstream side of bridge; read by Hester Kolb.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed of silt, sand, and gravel; clean except for drift. Left bank high and rocky; right bank wooded; subject to overflow at extreme high stages. Control is coarse gravel bar 300 feet below gage; clean except for brush growing on exposed part; fairly permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 20.42 feet at 5 p. m. December 13 (discharge, 19,000 second-feet); minimum stage, 1.64

feet at 5 p. m. September 30 (discharge, 14 second-feet).

1922-1924: Maximum stage recorded, 23.90 feet March 14, 1922 (discharge, 24,900 second-feet); minimum stage, 1.20 feet December 6, 1922 (discharge, 5 second-feet).

Accuracy.—Stage-discharge relation changed during high water in December; not affected by ice. Rating curves well defined between 1,340 and 18,000 second-feet and fairly well defined beyond these limits. Gage read to hundredths once daily except as described in footnote to table of daily discharge. Daily discharge ascertained by applying daily gage height to rating table. Records good.

#### ILLINOIS RIVER AT MORRIS, ILL.

LOCATION.—In sec. 9, T. 33 N., R. 7 E. third principal meridian, at highway bridge in Morris, Grundy County, 7 miles below station formerly maintained near Minooka and 10 miles below mouth of Kankakee River.

DRAINAGE AREA.—Indeterminate.

RECORDS AVAILABLE.—October 1, 1919, to September 30, 1924; January 1, 1903, to December 13, 1904, records were obtained at station near Minooka. Daily readings were obtained at present site by United States Engineer Corps December 10, 1899, to November 30, 1900, and April 20, 1903, to December 11, 1904.

Gage.—Chain gage attached to bridge; installed March 1, 1916; read by employee of United States Weather Bureau.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

Channel and control.—Bed of sand and gravel. Right bank high; left bank is overflowed at extremely high stages. Control probably a few miles below gage.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.2 feet August 10 (discharge, 50,100 second-feet); minimum stage, 6.1 feet October 12, 13, and 16 (discharge, 9,420 second-feet).

1919-1924; Maximum stage recorded, 20.1 feet April 12, 1922 (discharge, 60,600 second-feet); minimum stage, 5.2 feet August 9, 1920 (discharge, 7,600 second-feet).

A discharge of 67,800 second-feet occurred at 8 a. m. March 26, 1904. at station near Minooka.

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Flow at this station includes the flow from Chicago drainage canal. Operation of power plants at Lockport and Joliet above gage cause considerable diurnal at low and medium stages.

Accuracy.—Stage-discharge relation probably permanent during year. Rating curve well defined. Gage read to tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair.

COOPERATION.—Gage-height record furnished by United States Weather Bureau.

No discharge measurements made at this station during year.

Daily discharge, in second-feet, of Illinois River at Morris, Ill., for the year ending September 30, 1924

# ILLINOIS RIVER AT PEORIA, ILL.

LOCATION.—In sec. 2, T. 8 N., R. 8 E., at foot of Grant Street, Peoria, Peoria County, 3½ miles above station formerly maintained at Peoria & Pekin Union Railway bridge, and 4½ miles above mouth of Kickapoo Creek.

DRAINAGE AREA.—Indeterminate.

RECORDS AVAILABLE.—March 8, 1910, to September 30, 1924; March 10, 1903, to July 21, 1906, at Peoria & Pekin Union Railway bridge.

GAGE:—Vertical staff-gage-attached to wooden pile; read by employee of United States Engineer Corps.

DISCHARGE MEASUREMENTS.—Made from downstream side of Lower Free Bridge, 2 miles below gage.

CHANNEL AND CONTROL.—Bed of river, which forms control for medium and high stages, composed of mud; may shift. Dam at Copperas Creek probably forms control for lowest stages; permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 21.0 feet August 24 (discharge, 39,000 second-feet); minimum stage, 10.4 feet October 17 (discharge, 10,600 second-feet).

1910-1924: Maximum stage recorded, 24.80 feet April 15-17, 1922 (discharge, 56,700 second-feet); minimum discharge, less than 7,250 second-feet during period December 11, 1916, to January 10, 1917.

The highest known flood occurred in 1844, when a stage of about 26.6 feet on present gage was reached.

Ice.—Stage-discharge relation often affected by ice for short periods.

REGULATION.—Flow at this station includes water diverted from Lake Michigan through Chicago drainage canal. No diurnal fluctuation is noticeable.

Accuracy.—Stage-discharge relation practically permanent during year, except as affected by ice. Rating curve fairly well defined. Gage read to half-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good for open-water, fair for ice periods.

COOPERATION.—Gage-height record furnished by United States Engineer Corps.

The following discharge measurement was made:

July 8, 1924: Gage height, 18.68 feet; discharge, 31,200 second-feet.

Daily discharge, in second-feet, of Illinois River at Peoria, Ill., for the year ending September 30, 1924

#### ILLINOIS RIVER AT HAVANA, ILL.

Location.—In sec. 1, T. 21 N., R. 9 W., at highway bridge in Havana, Mason County, half a mile below mouth of Spoon River.

Drainage area.—17,200 square miles (since January 17, 1900, flow has been increased by diversion from Lake Michigan basin through Chicago drainage canal).

RECORDS AVAILABLE.—October 1, 1921, to September 30, 1924. Gage readings October, 1878, to May, 1881, January, 1896, to December, 1904, published in House Document 263, Fifty-ninth Congress; gage readings since December, 1904, in files of United States Engineer Corps.

Gage.—Vertical staff gage attached to pile 30 feet downstream from draw pier of bridge.

DISCHARGE MEASUREMENTS.—Made from highway bridge.

CHANNEL AND CONTROL.—Channel sandy and somewhat shifting.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 18.7 feet August 25 (discharge, 45,100 second-feet); minimum stage, 7.9 feet October 16 and 17 (discharge, 10,900 second-feet).

1921-1924: Maximum stage recorded, 22.4 feet April 20, 1922 (discharge, 65,000 second-feet); minimum stage, 7.2 feet August 31 to September 10, 1922 (discharge, 9,720 second-feet).

Maximum stage recorded since 1844 occurred in 1922.

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Flow at this station includes flow of the Chicago drainage canal. Accuracy.—Stage-discharge relation practically permanent during year except as affected by ice. Rating curve fairly well defined. Gage read to tenths once daily. Daily discharge determined by applying daily gage height to rating table. Records good for open water; fair for ice periods.

Cooperation.—Gage-height record by United States Engineer Corps.

No discharge measurements were made during year.

Daily discharge, in second-feet, of Illinois River at Havana, Ill., for the year ending September 30, 1924

#### ILLINOIS RIVER AT BEARDSTOWN ILL.

LOCATION.—In sec. 15, T. 18 N., R. 12 W., at highway bridge on State Street, Beardstown, Cass County, 9½ miles below mouth of Sangamon River.

Drainage area.—23,445 square miles. Natural run-off since January 17, 1900, increased by diversion from Lake Michigan through Chicago drainage canal. Records available.—October 1, 1920, to September 30, 1924. Gage read October 28, 1878, to May 30, 1881; November 9, 1881, to June 26, 1884; January 5, 1885, to June 30, 1891, by employees of United States Engineer Corps, and July 1, 1891, to September 30, 1924, by United States Weather Bureau; gage-height records 1878 to 1904 published in House Document

263, 59th Congress, since 1904 in annual reports of United States Weather Bureau.

GAGE.—Vertical staff gage attached to pile on inside of cribbing 40 feet above center span of bridge; read by employee of United States Weather Bureau-DISCHARGE MEASUREMENTS.—Made from downstream side of bridge.

Channel and control.—Bed composed of sand and mud. Except at very high stages, control is formed by LaGrange Dam, 11 miles downstream, probably permanent.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 19.1 feet July 4 and 5, August 28 and 29 (discharge, 55,400 second-feet); minimum stage, 8.3 feet October 17 (discharge, 11,800 second-feet).

1920-1924: Maximum stage recorded, 25.1 feet April 20, 1922 (discharge, 109,000 second-feet); minimum stage, 7.7 feet December 19-22, 1922 (discharge, 9,620 second-feet).

Maximum stage since 1844 occurred in 1922. On April 4, 1904, discharge was determined by United States Engineer Corps as 115,000 second-feet (gage-height, 20.0 feet).

ICE.—Stage-discharge relation not affected by ice.

REGULATION.—Flow at this station includes flow of the Chicago drainage canal. The stage at Beardstown is slightly affected, in occasional seasons of high water by backwater from Mississippi River and occasionally by backwater from Crooked Creek which enters 5 miles below Beardstown.

Accuracy.—Stage-discharge relation probably permanent. Rating curve well defined. Gage read to tenths once daily. Daily discharge determined by applying daily gage height to rating table. Records good.

Cooperation.—Gage-height record furnished by United States Weather Bureau.

The following discharge measurements were made:

April 10, 1924: Gage height, 17.49 feet; discharge, 52,700 second-feet; July 9, 1924: Gage height, 17.93 feet; discharge, 49,500 second-feet.

#### KANKAKEE RIVER AT MOMENCE, ILL.

LOCATION.—In sec. 24, T. 31 N., R. 13 E., at highway bridge in Momence, Kankakee County, half a mile below Chicago & Eastern Illinois Railroad bridge and 1½ miles above Tower Creek.

Drainage area.—2,340 square miles.

RECORDS AVAILABLE.—February 24, 1905, to July 20, 1906; December 3, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge over left channel; read by Henry Hanson. DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed of coarse gravel; somewhat shifting. River at gage divided into two channels by an island. Aquatic plants sometimes grow in bed during summer.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 4.56 feet March 30 (discharge, 6,800 second-feet); minimum discharge, 740 second-feet October 5-11.

1905-1906; 1915-1924: Maximum stage recorded, 7.5 feet January 21, 1916 (discharge not determined because of backwater from ice); maximum openwater stage, 6.4 feet January 22, 1916 (discharge estimated from extension of rating curve, 12,600 second-feet); minimum stage, 1.37 feet September 1, 16, and 17, 1919 (discharge, 306 second-feet).

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation seriously affected by ice during winter; affected by vegetation in channel during remainder of year. Standard rating curve well defined. Gage read to hundredths once daily. Daily discharge ascertained by indirect method for shifting channels. Records fair.

#### KANKAKEE RIVER AT CUSTER PARK, ILL.

Location.—In sec. 19, T. 32 N., R. 10 E., at Wabash Railroad bridge in Custer Park, Will County, half a mile above Horse Creek, and 15 miles below dam and power plant at Kankakee.

Drainage area.—4,870 square miles.

RECORDS AVAILABLE.—November 6, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by J. H. Swords.

DISCHARGE MEASUREMENTS.—Made from upstream side of bridge.

CHANNEL AND CONTROL.—Bed of solid rock strewn with boulders and gravel; right half of channel deep with fissures in bed; left half shallow; affected by vegetation during summer.

Extremes of discharge.—Maximum open-water stage recorded during year, 11.73 feet March 31 (discharge, 18,200 second-feet); minimum stage, 5.20 feet 6 p. m. October 7 (discharge, 625 second-feet).

1914-1924: Maximum stage recorded, 15.05 feet April 11, 1922 (discharge, 31,200 second-feet); minimum stage, 4.09 feet November 15, 1914 (discharge, 250 second-feet).

ICE.—Stage-discharge relation affected by ice.

REGULATION.—Operation of power plant at Kankakee causes slight fluctuation at gage.

Accuracy.—Stage-discharge relation changed slightly during year by growth of vegetation in channel; affected by ice during winter. Rating curves fairly well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table, except for period of ice-effect. Records good except for ice periods for which they are fair

The following discharge measurements were made:

November 6, 1923: Gage height, 7.05 feet; discharge, 3,680 second-feet.

April 3, 1924: Gage height, 10.91 feet; discharge, 15,300 second-feet.

July 23, 1924: Gage height, 6.06 feet; discharge, 1,860 second-feet.

Daily discharge, in second-feet, of Kankakee River at Custer Park, Ill., for the year ending September 30, 1924

# IROQUOIS RIVER NEAR CHEBANSE, ILL.

LOCATION.—In sec. 16, T. 29 N., R. 13 W., at highway bridge 4½ miles east of Chebanse, Kankakee County, 3 miles below Beaver Creek, and 6 miles above junction with Kankakee River.

Drainage area.—2,120 square miles.

RECORDS AVAILABLE.—April 13, 1923, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by Charles Haselow.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

Channel and control.—Bed of gravel and boulders; shifts occasionally.

Aquatic vegetation sometimes grows in channel during summer. Banks low and wooded. Low-water control is just below gage.

EXTREMES OF DISCHARGE.—Maximum stage during year, 10.58 feet March 31 (discharge, 10,400 second-feet); minimum stage, 0.93 foot October 10 (discharge, 95 second-feet).

1923-1924: Maximum stage occurred in 1924; minimum stage, 0.75 foot July 26, 1923 (discharge, 59 second-feet).

In the spring of 1913, a stage of approximately 19.6 feet was reached.

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation changed in December by vegetation going out of channel and in August or September by regrowth of vegetation; affected by ice during winter. Rating curves fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying rating table to daily gage height. Records fair.

#### DES PLAINES RIVER AT LEMONT, ILL.

LOCATION.—In sec. 20, T. 37 N., R. 11 E., at concrete highway bridge on Stephens Street, a quarter of a mile north of main section of Lemont, Cook County, and 8 miles above junction of Des Plaines River and Chicago drainage canal.

Drainage area.—705 square miles.

RECORDS AVAILABLE.—November 3, 1914, to September 30, 1924.

GAGE.—Staff gage attached to bridge; read by William Weck, jr.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—A concrete dam, forming a new control and changing the former stage-discharge relation, was built across the channel 500 feet below gage August 20, 1916; permanent except for slight repairs in August, 1920.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 6.55 feet August 9 (discharge, 4,360 second-feet); minimum stage, 2.85 feet October 14 and 15 (discharge, 150 second-feet).

1915-1924; Maximum stage recorded, 6.6 feet February 16, 1918 (discharge not determined because of backwater from ice). Maximum discharge recorded, 5,520 second-feet March 15, 1919. No flow occurred September 7, 8, 14-21, and 24-27, 1919, and July 25-31, 1921.

ICE.—Stage-discharge relation not seriously affected by ice.

DIVERSIONS.—During extremely high water part of flow spills into Chicago drainage canal at Willow Springs, 7 miles above station. Chicago Sanitary District obtained records of this overflow from 1915 to 1919. For years 1915–1919 see Water-Supply Paper 505 and for 1920–1923 see Water-Supply Paper 565. Estimates for the current year are shown in the following table:

Overflow from Des Plaines River linto Chicago drainage canal at Willow Springs

Date	Overflow in second- feet	Date	Overflow in second- feet	Date	Overflow in second- feet	Date	Overflow in second- feet
Oct. 19	80 520 950 520 430 290 20	Mar. 7. Mar. 8. Mar. 9. Mar. 10. Mar. 11. Mar. 12. Mar. 13. Mar. 14.	110 200 110 370 1,100 800 520	Mar. 15 Mar. 29 Mar. 30 Mar. 31 Apr. 1 Apr. 2 Apr. 5	118 370 540 950 620 520 370 110	Aug. 7. Aug. 8. Aug. 9. Aug. 10. Aug. 11. Aug. 12. Aug. 13.	250° 1, 200° 2, 700° 1, 480 1, 200° 200° 130° 50°

Accuracy.—Stage-discharge relation permanent at low and medium stages; at high stages affected by vegetation in overflow area. Rating curve used October 1 to April 30 well defined; rating curves used May 1 to September 30, well defined below and fairly well defined above 1,400 second-feet. Gage read to quarter tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good except for high stages, for which they are fair.

Discharge measurements of Des Plaines River at Lemont, Ill., during the year ending September 30, 1924

NOTE.—Discharge in second-feet per square mile and run-off in inches not computed for October, March, April, and August, on account of overflow into Chicago drainage canal at Willow Springs.

# DES PLAINES RIVER AT JOLIET, ILL.

LOCATION.—In NE. ½ sec. 9, T. 35 N., R. 10 E., at Jackson Street Bridge, Joliet, Will County, 1,200 feet above Cass Street Bridge.

Drainage area.—Indeterminate.

RECORDS AVAILABLE.—December 3, 1914, to September 30, 1924; at Cass Street Bridge September 5 to December 19, 1914.

GAGE.—Gurley water-stage recorder installed December 3, 1914; read by H. A. McCann.

DISCHARGE MEASUREMENTS.—Made from Cass Street Bridge.

Channel and control.—Channel excavated in solid rock, with a concrete wall on either side; permanent.

EXTREMES OF DISCHARGE.—Maximum mean daily discharge during days of record for the year, 16,000 second-feet August 9; minimum mean daily discharge, 7,600 second-feet, December 15.

1914-1924: Maximum mean daily discharge during days of record, 18,400 second-feet, March 18, 1919; minimum mean daily discharge, 5,420 second-feet, April 25, 1915.

ICE.—Stage-discharge relation not affected by ice.

Diversions.—Water is diverted to Illinois & Michigan Canal at Dam No. 1 100 feet above gage.

REGULATION.—Flow past gage is largely regulated by operation of power plant of Chicago Sanitary District at Lockport, which utilizes the flow of Chicago drainage canal and, to a lesser extent, by the operation of Economy Light & Power Co's plant, 100 feet above gage.

ACCURACY.—Stage-discharge relation permanent; not affected by ice. ing curve well defined. Operation of water-stage recorder satisfactory except as noted in footnote to table of daily discharge. Daily discharge ascertained by use of discharge integrator. Records good except for estimated periods for which they are fair.

The following discharge measurements were made:

Des Plaines River, June 13, 1924: Gage height, 5.54 feet; discharge measured at Ruby Street, above head of Illinois & Michigan Canal 11,600 second-feet. Illinois & Michigan Canal: May 14, discharge, 424 second-feet; June 13, discharge, 371 second-feet.

Daily discharge, in second-feet, of Des Plaines River at Joliet, Ill., for the year ending September 30, 1924

#### FOX RIVER AT ALGONQUIN, ILL.

LOCATION.—In NW. 1/4 sec. 34, T. 43 N., R. 8 E. third principal meridian, at Chicago Street Bridge in Algonquin, McHenry County, 100 feet above Public Service Co's dam and 300 feet above Crystal Lake outlet.

RECORDS AVAILABLE.—October 1, 1915, to September 30, 1924.

Drainage area.—1,340 square miles (measured on map of United States Geological Survey; scale, 1:500,000).

GAGE.—Enamel staff gage attached to concrete abutment of bridge; read by Edward Pedersen.

Channel and control.—Control is a concrete dam 100 feet below gage; permanent since August, 1919.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 3.50 feet April 4 and August 22 (discharge, 3,660 second-feet); minimum stage, 1.19 feet January 28 (discharge, 347 second-feet).

1916-1924: Maximum stage recorded, 5.3 feet March 31, 1916 (discharge, 7,120 second-feet); minimum stage, 0.59 foot August 31, 1918 (discharge, 67 second-feet).

Icn.—Stage-discharge relation not affected by ice.

REGULATION.—Gristmill at dam runs on average of about 4 hours a day except Sundays during September to March, inclusive, and one day a week during remainder of year. Effect of operation of mill on gage heights is appreciable only at low stages and gage is usually read when mill is not running.

Accuracy.—Stage-discharge relation permanent; not affected by ice during winter. Rating curve well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good.

The following discharge measurement was made:

April 4, 1924: Gage height, 3.47 feet; discharge, 3,610 second-feet.

Daily discharge, in second-feet, of Fox River at Algonquin, Ill., for the year ending September 30, 1924

# FOX RIVER AT WEDRON, ILL.

LOCATION.—In sec. 9, T. 34 N., R. 4 E., at highway bridge in Wedron, La Salle County, 1,000 feet above Buck Creek.

Drainage area.—2,500 square miles.

RECORDS AVAILABLE.—November 5, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by Charles Davis.

DISCHARGE MEASUREMENTS.—Made from upstream side of bridge.

Channel and control.—Bed of river at measuring section is soft and probably shifts. Control 1,000 feet downstream of coarse gravel and large boulders; practically permanent; affected at times by growth of aquatic plants.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 11.6 feet: August 9 (discharge, 10,100 second-feet); minimum stage, 6.21 feet October 12 (discharge, 500 second-feet).

1915-1924: Maximum stage recorded, 17.22 feet January 22, 1916 (discharge not determined because of backwater from ice). Maximum openwater stage recorded, 14.2 feet March 26, 1920 (discharge, 17,900 second-feet). Minimum discharge, 105 second-feet, November 20, 1914 (measured by current meter).

REGULATION.—Slight diurnal fluctuation is caused by operation of power plants at and above Aurora.

ICE.—Stage-discharge relation seriously affected by ice.

Accuracy.—Stage-discharge relation affected by vegetation in channel in fall: and summer; by ice during winter. Rating curves well defined. Gage read to hundredths twice daily. Daily discharge ascertained by applying mean daily gage height to rating table. Records good except during winter for which they are fair.

#### VERMILION RIVER NEAR STREATOR, ILL.

LOCATION.—In sec. 1, T. 30 N., R. 3 E. third principal meridian, at highway bridge known as Bridge No. 3, 1½ miles south of Streator, La Salle County, and 100 feet below Santa Fe Railway bridge.

Drainage area.—1,080 square miles.

RECORDS AVAILABLE.—July 27, 1914, to September 30, 1924.

GAGE.—Chain gage attached to highway bridge; read by Andrew Gall.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Channel gravel and rocks. Brush and timber growing on banks above low-water stages. Control loose rocks at low stages; shifts occasionally.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 12.6 feet June 28 (discharge, 6,410 second-feet); minimum stage, 0.67 foot October 1 and 2 (discharge, 0.2 second-foot).

1914–1924: Maximum stage recorded, 22.9 feet April 20, 1920 (discharge, 16,500 second-feet); minimum, no flow August 25–28, September 16–30, 1920, August 24–27, September 3, and 4, 1923.

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation changed slightly during June, probably by shifting of loose rocks below gage; affected by ice for a short period during winter. Rating curves fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Open-water records good except for very low stages, for which they are fair; records during period of ice effect poor.

#### MACKINAW RIVER NEAR GREEN VALLEY, ILL.

LOCATION.—In sec. 15, T. 23 N., R. 5 W., at Chicago & Northwestern Railway bridge, 3 miles north of Green Valley, Tazewell County.

Drainage area.—1,100 square miles (measured on United States Geological Survey map; scale, 1: 500,000).

RECORDS AVAILABLE. -- March 9, 1921, to September 30, 1924.

GAGE.—Chain gage attached to guardrail on downstream side of bridge; installed March 28, 1921; read by John Eggena.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Channel is sandy and somewhat shifting. Banks are overflowed during extremely high water. No well-defined control.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.32 feet August 22 (discharge, 18,500 second-feet); minimum stage, 0.78 foot October 10, 11, 12, and 16 (discharge, 38 second-feet).

1921-1924: Maximum stage occurred August 22, 1924; minimum discharge, 30 second-feet September 28 to October 5, October 13 and 14, 1922 ICE.—Stage-discharge relation affected by ice during severe winters.

ACCURACY.—Stage-discharge relation changed slightly during February, June, and August; affected by ice in winter. Rating curves well defined below and fairly well defined above 10,000 second-feet. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good for open-water periods, fair for ice periods.

## SPOON RIVER AT SEVILLE, ILL.

LOCATION.—In sec. 24, T. 6 N., R. 1 E. fourth principal meridian, at Toledo, Peoria & Western Railway bridge one-fourth mile east of railway station at Seville, Fulton County.

Drainage area.—1,600 square miles.

RECORDS AVAILABLE.—July 24, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by R. M. Boales.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—A loose rock and timber dam 1½ miles below gage probably forms control at medium stages; at other stages control is clay and sand; somewhat shifting.

EXTREMES OF STAGE.—Maximum stage recorded during year, 30.5 feet August 22 (discharge, 28,900 second-feet); minimum stage, 2.97 feet October 11 (discharge, 58 second-feet).

1914-1924: Maximum stage occurred August 22, 1924; minimum stage, 1.35 feet July 31 and August 27-29, 1914 (discharge, 3.8 second-feet).

High water of September, 1911, reached a height of approximately 25.8 feet on present gage; flood of 1883 when there was backwater from ice reached a stage of about 33.0 feet on the present gage.

Ice.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation changed during high water in March; affected by ice during short periods in winter and by drift during high water in August. Rating curves fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table except for period of ice effect. Records fair, except during period of ice effect and for high stages August 23 to September 30 for which they are poor.

The following discharge measurements were made:

April 9, 1924: Gage height, 5.63 feet; discharge, 808 second-feet.

June 30, 1924: Gage height, 25.43 feet; discharge, 19,900 second-feet.

August 24, 1924: Gage height, 24.71 feet; discharge, 16,900 second-feet.

Daily discharge, in second-feet, of Spoort River at Seville, Ill., for the year ending

#### SANGAMON RIVER AT MONTICELLO, ILL.

LOCATION.—In sec. 12, T. 18 N., R. 5 E. third principal meridian, at Illinois Central Railroad bridge half a mile west of Monticello, Piatt County.

Drainage area.—550 square miles.

RECORDS AVAILABLE.—February 4, 1908, to December 31, 1912; June 23, 1914, to September 30, 1924.

Gage.—Chain gage attached to downstream side of bridge; read by Malon Taylor.

DISCHARGE MEASUREMENTS.—Made from cownstream side of bridge and wooden trestle approach or by wading.

CHANNEL AND CONTROL.—Control consists of fine gravel; likely to shift.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 13.4 feet August 21 (discharge, 5,250 second-feet); minimum stage, 2.60 feet October 11-13 and August 8 (discharge, 40 second-feet).

1908-1912; 1914-1924: Maximum stage recorded, 15.2 feet May 14, 1908 (discharge, 9,280 second-feet); minimum stage, 1.5 feet July 31 to August 3, 1914 (discharge, 1 second-foot).

Maximum stage during flood of March and April, 1913, 17.7 feet March 25 (discharge unknown).

ICE.—Stage-discharge relation not seriously affected by ice.

Accuracy.—Stage-discharge relation changed slightly during August; affected by ice January 25-30. Rating curves well defined below 1,000 second-feet; fairly well defined above. Gage read to half-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good.

#### SANGAMON RIVER AT RIVERTON ILL.

LOCATION.—In SE. 1/4 SW. 1/4 sec. 9, T. 16 N., R. 4 W. third principal meridian, at Wabash Railroad bridge, one-fourth mile west of Riverton, Sangamon County, and 21/2 miles below mouth of South Fork.

Drainage area.—2,560 square miles.

RECORDS AVAILABLE.—February 13, 1908, to December 31, 1912; August 7, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by J. J. Washburn.

DISCHARGE MEASUREMENTS.—Made from railroad bridge, from highway bridge one-fourth mile upstream, or by wading.

CHANNEL AND CONTROL.—Measuring section is at a pool; control consists of fine gravel; shifts slightly.

EXTREMES OF DISCHARGE.—Maximum stage during year probably occurred in December when no record was obtained; maximum stage recorded, 22.90 feet June 28 (discharge, 9,500 second-feet); minimum discharge, 214 second-feet, August 19.

1908-1912; 1914-1924: Maximum stage recorded, 28.22 feet April 11, 1922 (discharge, 22,700 second-feet); minimum stage, 6.9 feet October 3-15, 1915 (discharge, 3 second-feet).

High water of 1883 reached a height of approximately 32 feet on present gage, and that of 1875 is said to have been 0.5 foot lower (discharge not determined).

ICE.—Stage-discharge relation not seriously affected by ice.

Accuracy.—Stage-discharge relation changed slightly during winter. Rating curves well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good.

The following discharge measurements were made:

October 4, 1923: Gage height, 10.00 feet; discharge, 607 second-feet.

April 11, 1924: Gage height, 15.81 feet; discharge, 2,690 second-feet. July 3, 1924: Gage height, 19.38 feet; discharge, 4,830 second-feet.

Daily discharge, in second-feet, of Sangamon River at Riverton, Ill., for the year ending September 30, 1924

#### SOUTH FORK OF SANGAMON RIVER AT POWER PLANT, NEAR TAYLORVILLE, ILL.

LOCATION.—In sec. 14, T. 13 N., R. 3 W., at Chicago & Illinois Midland Railroad bridge 6 miles northwest of Taylorville, Christian County, 500 feet east of power plant of Central Illinois Public Service Co., 5 miles below mouth of Bear Creek, and 8 miles below station formerly maintained at Wabash Railroad bridge.

Drainage area.-510 square miles.

RECORDS AVAILABLE. May 18, 1917, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by H. Hendricks.

DISCHARGE MEASUREMENTS. - Made from bridge or by wading.

CHANNEL AND CONTROL.—Channel of clay and mud; filled in with coal mine waste; shifting. Banks wooded; overflow above medium stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 20.10 feet December 15 (discharge, 6,000 second-feet); minimum discharge, 5.6 second-feet September 9-11 and 21.

1917-1924: Maximum discharge recorded, 11,800 second-feet, March 15, 1922; minimum discharge, no flow August 29 and October 6-23, 1922.

A stage of about 27.3 feet is said to have been reached January 31, 1916 (discharge, 11,300 second-feet).

ICE.—Stage-discharge relation not affected by ice.

DIVERSIONS.—An average of about 0.5 second-foot is used for boiler feed and other purposes at power plant just above gage.

Accuracy.—Stage-discharge relation changed during year by washing down to low-water control of coal wastes placed in channel July, 1923; dates of shifts uncertain. Rating curves fairly well defined. Daily discharge ascertained by applying daily gage height to rating table. Records fair for medium and high stages; fair for low stages for months when measurements were made; poor for other periods.

Discharge measurements of South Fork of Sangamon River at power plant, near Taylorville, Ill., during the year ending September 30, 1924

### CROOKED CREEK AT RIPLEY, ILL.

Location.—In sec. 33, T. 1 N., R. 2 W., at highway bridge one-fourth mile east of Ripley, Brown County.

DRAINAGE AREA.—1,310 square miles (measured on United States Geological Survey map; scale, 1:500,000).

RECORDS AVAILABLE. - Merch 12, 1921, to September 30, 1924.

Gags.—Chain gage attached to downstream side of bridge; read by Mrs. John Hess.

DECHARGE MEASUREMENTS.—Made from downstream side of bridge.

CHANNEL AND CONTROL.—Bed composed of soft mud and clay. Banks high; overflowed only during extreme stages. Control not well defined; likely to shift. Backwater from Illinois River occurs at high stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 25.0 feet, July 25 (determined from high-water marks, discharge, estimated 12,500 second-feet); minimum stage, 2.18 feet October 13 (discharge, 23 second-feet.)

1921-1924: Maximum stage occurred in 1924; minimum discharge, 9 second-feet September 8 and 9, 1922.

Old high-water marks, date unknown, are at a stage of about 26.0 feet on gage.

ICE.—Stage-discharge relation affected by ice.

Accuracy.—Stage-discharge relation probably changed during July; affected by ice and by backwater from Illinois River. Rating curves fairly well defined below and poorly defined above 5,650 second-feet. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair for low and medium stages during open water and periods of no backwater, poor for high stages and during periods of ice effect and backwater.

The following discharge measurements 11 were made:

April 10, 1924: Gage height, 6.66 feet; discharge, 620 second-feet.

July 1, 1924: Gage height, 19.01 feet; discharge, 5,790 second-feet.

August 25, 1924: Gage height, 12.73 feet; discharge, 2,700 second-feet.

Daily discharge, in second-feet, of Crooked Creek at Ripley, Ill., for the year ending September 30, 1924

Note.—Discharge estimated because of ice Jan. 4-8, and 16-29, from gage heights, observer's notes, records on Spoon River at Seville, and weather records. Discharge estimated Apr. 1-20, June 29 to July 18, Aug. 23 to Sept. 9, because of backwater from Illinois River from results of discharge measurements and gage-heights of Illinois River at Beardstown. Braced figures show mean discharges for periods indicated.

Monthly discharge of Crooked Creek at Ripley, Ill., for the year ending September-30, 1924

## MACOUPIN CREEK NEAR KANE, ILL.

LOCATION.—In sec. 7, T. 9 N., R. 11 W., on Chicago & Alton Railway Bridge, 3 miles northwest of Kane, Greene County.

Drainage area.—865 square miles (measured on United States Geological: Survey map; scale 1:500,000).

RECORDS AVAILABLE.—March 11, 1921, to September 30, 1924.

GAGE.—Vertical staff; lower section on old piling between piers, intermediate section on left pier, high-water section on left abutment; read by Claude Linn.

DISCHARGE MEASUREMENTS.—Made from railway bridge, from bridges over flood ehannels one-fourth mile south and one-eighth mile north, respectively, of main channel, or by wading.

CHANNEL AND CONTROL—New channel dredged in July, 1923, decreased length and increased slope of stream. Channel was not changed for about 150 feet below gage and in this distance has been eroding down to grade of excavation. Control at medium and high stages is in new channel.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 16.1 feet December 16 (discharge, 5,050 second-feet); minimum stage, 0.25 foot August 20, 23, September 8, and 10 (discharge, 22 second-feet).

1921-1924: Maximum stage recorded, 21.6 feet March 15, 1922 (discharge, 15,000 second-feet); minimum discharge, 1 second-foot September 29, October 3, 5, and 15, 1922.

High water of 1915 reached a stage of 26.5 feet.

ICE.—Stage-discharge generally affected by ice.

Accuracy.—Low-water control shifted in December. Rating at medium and high stages computed by Kutter's formula for new channel. Rating curve used October 1 to December 15 well defined from 296 to 480 second-feet, fairly well defined below and poorly defined above these limits. Rating curve used December 16 to September 30 fairly well defined between 45 and 730 second-feet; poorly defined beyond these limits. Gage read to half-tenths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records fair for medium stages, poor for low and high stages.

The following discharge measurements were made:

May 20, 1924: Gage height, 1.81 feet; discharge, 110 second-feet.

July 1, 1924: Gage height, 2.47 feet; discharge, 202 second-feet.

Daily discharge, in second-feet, of Macoupin Creek near Kane, Ill., for the year ending September 30, 1924

#### KASKASKIA RIVER AT VANDALIA, ILL.

LOCATION.—In sec. 16, T. 6. N., R. 1 E. third principal meridian, at highway bridge at east end of Main Street, Vandalia, Fayette County, 3½ miles above Hickory Creek.

Drainage area.—1,980 square miles.

RECORDS AVAILABLE.—February 26, 1908, to December 31, 1912; August 11, 1914, to September 30, 1924.

GAGE.—Chain gage attached to bridge; read by Wilson Haley.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Measuring section is at a pool; control likely to shift.

EXTREMES OF DISCHARGE.—Maximum stage during year, 19.82 feet December 15 (discharge, 10,500 second-feet); minimum stage, 1.37 feet August 24 (discharge, 78 second-feet).

1908-1912; 1914-1924: Maximum stage recorded, 23.0 feet June 5, 1917. Maximum discharge, 18,800 second-feet April 18, 1922; minimum discharge, 3.5 second-feet August 22, 1911.

ICE.—Stage-discharge relation not seriously affected by ice.

Accuracy.—Stage-discharge relation unchanged during year; affected by ice for short period. Rating curve fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good.

The following discharge measurements were made:

May 23, 1924: Gage height, 3.52 feet; discharge, 487 second-feet.

September 23, 1924: Gage height, 4.02 feet; discharge, 611 second-feet.

Daily discharge, in second-feet, of Kaskaskia River at Vandalia, Ill., for the year ending September 30, 1924

#### BIG MUDDY RIVER AT PLUMFIELD ILL.

LOCATION.—In W. ½ sec. 20, T. 7 S., R. 2 E., at highway bridge at Plumfield, Franklin County, 6 miles west of West Frankfort, 1½ miles below mouth of Middle Fork, and 2 miles below station formerly maintained at Chicago, Burlington & Quiney Railroad bridge.

Drainage area.—753 square miles.

RECORDS AVAILABLE.—August 18, 1914, to September 30, 1924. June 16, 1908, to December 31, 1912, records obtained at Chicago, Burlington & Quincy Railroad bridge.

GAGE.—Chain gage attached to bridge; read by Louis Robertson.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

CHANNEL AND CONTROL.—Practically permanent at low stages. Banks wooded; right bank is overflowed at high stages.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 19.4 feet, December 15 (discharge, 4,880 second-feet); minimum stage, 1.10 feet August 24 (discharge, 3.5 second-feet).

1914–1924 Maximum stage recorded, 30.2 feet February 1, 1916 (discharge, 16,300 second-feet); no flow August 18–26, 1914.

Ice.—Stage-discharge relation not usually affected by ice.

Accuracy.—Stage-discharge relation practically constant except as affected by vegetation at high stages during year; slightly affected by ice during winter. Rating curve well defined below 1,000 second-feet and fairly well defined above. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table. Records good for medium stages, otherwise fair.

The following discharge measurements were made:

May 21, 1924: Gage height, 8.00 feet; discharge, 767 second-feet.

September 26, 1924: Gage height, 1.51 feet; discharge, 12.0 second-feet.

Daily discharge, in second-feet, of Big Muddy River at Plumfield, Ill., for the year ending September 30, 1924

#### BIG MUDDY RIVER AT MURPHYSBORO, ILL.

LOCATION.—In SW. 1/4 sec. 8, T. 9 S., R. 2 W., at lower highway bridge on South Twentieth Street, Murphysboro, Jackson County, a quarter of a mile below mouth of Louis Creek.

RECORDS AVAILABLE.—December 6, 1916, to September 30, 1924; fragmentary. Drainage area.—2,170 square miles (measured on map of United States Geological Survey; scale, 1: 500,000).

GAGE.—Chain gage attached to bridge; read by Clarence Jacobs.

CHANNEL AND CONTROL.—Bed of heavy clay; likely to shift.

DISCHARGE MEASUREMENTS.—Made from bridge or by wading.

EXTREMES OF DISCHARGE.—Maximum stage recorded during year, 26.40 feet December 17 (backwater from Mississippi River); minimum stage, 2.28 feet September 30 (discharge, 14 second-feet).

1917-1924: Maximum discharge recorded, 15,600 second-feet January 10, 1917; minimum discharge, 1.0 second-foot August 1, 1921.

About February 2, 1916, a stage of 39.6 feet (the highest known stage) was reached (discharge, ascertained from extension of rating curve, 28,000 second-feet).

ICE.—Stage-discharge relation not affected by ice.

Accuracy.—Stage-discharge relation changed during high water in December; not affected by ice during winter; affected by backwater from Mississippi River whenever height on gage of United States Weather Bureau at Chester, Ill., is above approximately 10 feet. Rating curves fairly well defined. Gage read to hundredths once daily. Daily discharge ascertained by applying daily gage height to rating table; not determined for periods of backwater. Records fair.

The following discharge measurement was made: September 26, 1924: Gage height, 3.85 feet, discharge, 113 second-feet.

Daily gage height, in feet, of Big Muddy River at Murphysboro, Ill., for the year ending September 30, 1924
